This Technical Reference Manual (TRM) in any form, software or printed matter, contains proprietary information of Oracle Corporation; it is provided under an Oracle Corporation agreement containing restrictions on use and disclosure and is also protected by copyright, patent, and other intellectual property law. Restrictions applicable to this TRM include, but are not limited to: (a) exercising either the same degree of care to safeguard the confidentiality of this TRM as you exercise to safeguard the confidentiality of your own most important Confidential Information or a reasonable degree of care, whichever is greater; (b) maintaining agreements with your employees and agents that protect the Confidential Information of third parties such as Oracle Corporation and instructing such employees and agents of these requirements for this TRM; (c) restricting disclosure of this TRM to those of your employees who have a "need to know" consistent with the purposes for which this TRM was disclosed to you; (d) maintaining this TRM at all times on your premises; (e) not removing or destroying any proprietary or confidential legends or markings placed upon this TRM in whatever form, software or printed matter; and (f) not reproducing or transmitting this TRM in any form or by any means, electronic or mechanical, for any purpose, without the express written permission of Oracle Corporation. You should not use this TRM in any form, software or printed matter, to create software that performs the same or similar functions as any Oracle Corporation products.

The information in this TRM is subject to change without notice. If you find any problems in the TRM in any form, software or printed matter, please report them to us in writing. Oracle Corporation does not warrant that this TRM is error-free. This TRM is provided to customer "as-is" with no warranty of any kind. This TRM does not constitute Documentation as that term is defined in Oracle's agreements.

Reverse engineering of the Programs (software and documentation) associated with this TRM are prohibited. The Programs associated with this TRM are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be licensee's responsibility to take all appropriate fail-safe, back-up, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and Oracle disclaims liability for any damages caused by such use of the Programs.

Restricted Rights Legend

This TRM and the Programs associated with this TRM delivered subject to the DOD FAR Supplement are 'commercial computer software' and use, duplication and disclosure of the TRM and the Programs associated with this TRM shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement. Otherwise, this TRM and the Programs associated with this TRM delivered subject to the Federal Acquisition Regulations are 'restricted computer software' and use, duplication and disclosure of the TRM and the Programs associated with this TRM shall be subject to the restrictions in FAR 52.227-14, Rights in Data --- General, including Alternate III (June 1987). Introduction

The *Oracle Bills of Material Technical Reference Manual* provides the information you need to understand the underlying structure of Oracle Bills of Material. After reading this manual, you should be able to convert your existing applications data, integrate your existing applications with Oracle Bills of Material, and write custom reports for Oracle Bills of Material, as well as read data that you need to perform other tasks.

This chapter introduces you to the *Oracle Bills of Material Technical Reference Manual*, and explains how to use it.

Introduction

At Oracle, we design and build applications using Oracle Designer, our systems design technology that provides a complete environment to support developers through all stages of a systems life cycle. Because we use a repository-based design toolset, all the information regarding the underlying structure and processing of our applications is available to us online. Using Oracle Designer, we can present this information to you in the form of a technical reference manual.

This *Oracle Bills of Material Technical Reference Manual* contains detailed, up-to-date information about the underlying structure of Oracle Bills of Material. As we design and build new releases of Oracle Bills of Material, we update our Oracle Designer repository to reflect our enhancements. As a result, we can always provide you with an *Oracle Bills of Material Technical Reference Manual* that contains the latest technical information as of the publication date. Note that after the publication date we may have added new indexes to Oracle Bills of Material to improve performance.

About this Manual

This manual describes the Oracle Applications Release 11i data model, as used by Oracle Bills of Material; it discusses the database we include with a fresh install of Oracle Applications Release 11i. If you have not yet upgraded to Release 11i, your database may differ from the database we document in this book.

If you have upgraded from a previous release, you might find it helpful to use this manual with the appropriate *Oracle Applications Product Update Notes* manual. The product update notes list database changes and seed data changes in Oracle Bills of Material between releases. The *Oracle Applications Product Update Notes Release 11* manual describes the changes between Release 10.7 and Release 11, and the *Oracle Applications Product Update Notes Release 11i* manual describes the changes between Release 11 and Release 11i.

You can contact your Oracle representative to confirm that you have the latest technical information for Oracle Bills of Material. You can also use Oracle *MetaLink* which is accessible through Oracle's Support Web Center (http://www.oracle.com/support/elec_sup).

Finding the Latest Information

The *Oracle Bills of Material Technical Reference Manual* contains the latest information as of the publication date. For the latest information we encourage you to use *OracleMetaLink* which is accessible through Oracle's Support Web Center (http://www.oracle.com/support/elec_sup).

Audience

The *Oracle Bills of Material Technical Reference Manual* provides useful guidance and assistance to:

- Technical End Users
- Consultants
- Systems Analysts
- System Administrators
- Other MIS professionals

This manual assumes that you have a basic understanding of structured analysis and design, and of relational databases. It also assumes that you are familiar with Oracle Application Object Library and Oracle Bills of Material. If you are not familiar with the above products, we suggest that you attend one or more of the training classes available through Oracle Education (see: Other Information Sources: page 1 – 8).

How This Manual is Organized

This manual contains two major sections, High-Level Design and Detailed Design.

High-Level Design

This section, Chapter 2, contains database diagrams and lists each database table and view that Oracle Bills of Material uses. This chapter also has a list of modules.

Detailed Design

This section, Chapter 3, contains a detailed description of the Oracle Bills of Material database design, including information about each database table and view you might need for your custom reporting or other data requirements.

How to Use This Manual

The *Oracle Bills of Material Technical Reference Manual* is a single, centralized source for all the information you need to know about the underlying structure and processing of Oracle Bills of Material. For example, you can use this manual when you need to:

- Convert existing application data
- Integrate your Oracle Bills of Material application with your other applications systems
- Write custom reports
- Define alerts against Oracle Applications tables
- Configure your Oracle Self-Service Web Applications
- Create views for decision support queries using query tools
- Create business views for Oracle Discoverer

You need not read this manual cover to cover. Use the table of contents and index to quickly locate the information you need.

How Not To Use This Manual

Do not use this manual to plan modifications

You should not use this manual to plan modifications to Oracle Bills of Material. Modifying Oracle Bills of Material limits your ability to upgrade to future releases of your Oracle Bills of Material application. In addition, it interferes with our ability to give you the high-quality support you deserve.

We have constructed Oracle Bills of Material so that you can customize it to fit your needs without programming, and you can integrate it with your existing applications through interface tables. However, should you require program modifications, you should contact our support team (see: Other Information Sources; page 1 – 8). They can put you in touch with Oracle Services, the professional consulting organization of Oracle. Their team of experienced applications professionals can make the modifications you need while ensuring upward compatibility with future product releases.

Do not write data into non-interface tables

Oracle reserves the right to change the structure of Oracle Applications tables, and to change the meaning of, add, or delete lookup codes and data in future releases. Do not write data directly into or change data in non-interface tables using SQL*Plus or other programming tools because you risk corrupting your database and interfering with our ability to support you.

Moreover, this version of the *Oracle Bills of Material Technical Reference Manual* does not contain complete information about the dependencies between Oracle Bills of Material applications tables. Therefore, you should write data into only those tables we identify as interface tables. If you write data into other non-interface tables, you risk violating your data integrity since you might not fulfill all the data dependencies in your Oracle Bills of Material application.

You are responsible for the support and upgrade of the logic within the procedures that you write, which may be affected by changes between releases of Oracle Applications.

Do not rely on upward compatibility of the data model

Oracle reserves the right to change the structure of Oracle Bills of Material tables, and to change the meaning of, add, or delete lookup codes and other data in future releases. We do not guarantee the upward compatibility of the Oracle Bills of Material data model. For example, if you write a report that identifies concurrent requests that end in Error status by selecting directly from Oracle Application Object Library tables, we do not guarantee that your report will work properly after an upgrade.

About Oracle Application Object Library

The *Oracle Bills of Material Technical Reference Manual* may contain references to tables that belong to Oracle Application Object Library. Oracle Application Object Library is a collection of pre-built application components and facilities for building Oracle Applications and extensions to Oracle Applications. Oracle Application Coding Standards use the Oracle Application Object Library and contains shared components including but not limited to -- forms, subroutines, concurrent programs and reports, database tables and objects, messages, menus, responsibilities, flexfield definitions and online help.

Oracle Proprietary, Confidential Information--Use Restricted by Contract

Attention: Oracle does not support *any* customization of Oracle Application Object Library tables or modules, not even by Oracle consultants. (Oracle Application Object Library tables generally have names beginning with FND_%.)

Accordingly, this manual does not contain detailed information about most Oracle Application Object Library tables used by Oracle Bills of Material.

A Few Words About Terminology

The following list provides you with definitions for terms that we use throughout this manual:

Relationship

A relationship describes any significant way in which two tables may be associated. For example, rows in the Journal Headers table may have a one-to-many relationship with rows in the Journal Lines table.

Database Diagram

A database diagram is a graphic representation of application tables and the relationships between them.

Summary Database Diagram

A summary database diagram shows the most important application tables and the relationships between them. It omits tables and relationships that contribute little to the understanding of the application data model. Typically, a summary database diagram shows tables that contain key reference and transaction data.

Module

A module is a program or procedure that implements one or more business functions, or parts of a business function, within an application. Modules include forms, concurrent programs and reports, and subroutines.

Application Building Block

An application building block is a set of tables and modules (forms, reports, and concurrent programs) that implement closely-related

Oracle Proprietary, Confidential Information--Use Restricted by Contract

database objects and their associated processing. Said another way, an application building block is a logical unit of an application.

QuickCodes

QuickCodes let you define general purpose, static lists of values for window fields. QuickCodes allow you to base your program logic on lookup codes while displaying user-friendly names in a list of values window. QuickCodes simplify name and language changes by letting you change the names your end users see, while the codes in your underlying programs remain the same.

Form

A form is a module comprised of closely related windows that are used together to perform a task. For example, the Enter Journals form in Oracle General Ledger includes the Enter Journals window, the Batch window, and the More Actions window among others. The Enter Journals window is the main window, and from it, you can use buttons to navigate to other windows in the form. The form name usually corresponds to the main window in the form, and is frequently a window you open directly from the Navigator.

Other Information Sources

There are additional information sources, including other documentation, training and support services, that you can use to increase your knowledge and understanding of Oracle Designer, Oracle Application Object Library, and Oracle Bills of Material. We want to make these products easy for you and your staff to understand and use.

Oracle Designer Online Documentation

The online help for Oracle Designer describes how you can use Oracle Designer for your development needs.

Oracle Applications Developer's Guide

This guide contains the coding standards followed by the Oracle Applications development staff. It describes the Oracle Application Object Library components needed to implement the Oracle Applications user interface described in the *Oracle Applications User*

Oracle Proprietary, Confidential Information--Use Restricted by Contract

Interface Standards. It also provides information to help you build your custom Developer forms so that they integrate with Oracle Applications.

Oracle Applications User Interface Standards

This manual contains the user interface (UI) standards followed by the Oracle Applications development staff. It describes the UI for the Oracle Applications products and how to apply this UI to the design of an application built using Oracle Forms 6.

Oracle Bills of Material User Guide

Your user guide provides you with all the information you need to use your Release 11i Oracle Bills of Material application. Each user guide is organized for fast, easy access to detailed information in a function- and task-oriented organization.

Oracle Self-Service Web Applications Online Documentation

This documentation describes how Oracle Self-Service Web Applications enable companies to provide a self-service and secure Web interface for employees, customers, and suppliers. Employees can change their personal status, submit expense reports, or request supplies. Customers can check on their orders, and suppliers can share production schedules with their trading partners. This documentation is available in HTML only.

Oracle Applications Flexfields Guide

This guide provides flexfields planning, setup and reference information for the Oracle Bills of Material implementation team, as well as for users responsible for the ongoing maintenance of Oracle Applications product data. This manual also provides information on creating custom reports on flexfields data.

Oracle Workflow Guide

This manual explains how to define new workflow business processes as well as customize existing Oracle Applications-embedded workflow processes. You also use this guide to complete the setup steps necessary for any Oracle Applications product that includes workflow-enabled processes.

Oracle Alert User Guide

This manual explains how to define periodic and event alerts to monitor the status of your Oracle Applications data.

Multiple Reporting Currencies in Oracle Applications

If you use the Multiple Reporting Currencies feature to report and maintain accounting records in more than one currency, use this manual before implementing Oracle Bills of Material. This manual details additional steps and setup considerations for implementing Oracle Bills of Material with this feature.

Multiple Organizations in Oracle Applications

If you use the Oracle Applications Multiple Organization Support feature to use multiple sets of books for one Oracle Bills of Material installation, use this guide to learn about setting up and using Oracle Bills of Material with this feature. This book describes the Oracle Applications organization model, which defines business units and the relationships between them in an arbitrarily complex enterprise. Functional and technical overviews of multiple organizations are presented, as well as information about how to set up and implement this feature set in the relevant Oracle Applications products.

Oracle Manufacturing, Distribution, Sales and Service Open Interfaces Manual

This manual contains up-to-date information about integrating with other Oracle Manufacturing applications and with your other systems. This documentation includes open interfaces found in Oracle Manufacturing.

Oracle Applications Messages Manual

The Oracle Applications Messages Manual contains the text of numbered error messages in Oracle Applications. (Oracle Applications messages begin with the prefix "APP-".) It also provides information on the actions you take if you get a message. Note: This manual is available only in HTML format.

Installation and System Administration

Oracle Applications Installation Release Notes

This manual contains a road map to the components of the release, including instructions about where to access the Release 11i documentation set.

Oracle Applications Concepts

Designed to be the first book the user reads to prepare for an installation of Oracle Applications. It explains the technology stack, architecture, features and terminology for Oracle Applications Release 11i. This book also introduces the concepts behind and major uses of Applications-wide features such as MRC, BIS, languages and character sets (NLS, MLS), BIS, Self-Service Web Applications and so on.

Installing Oracle Applications

Describes the One-Hour Install process, the method by which Release 11i will be installed. This manual includes all how-to steps, screen shots and information about Applications-wide post-install tasks.

Using the AD Utilities

This manual contains how-to steps, screen shots and other information required to run the various AD utilities such as AutoInstall, AutoPatch, AD Administration, AD Controller, Relink and so on. It also contains information about when and why you should use these utilities.

Upgrading Oracle Applications

This manual contains all the product specific pre- and post-upgrade steps that are required to upgrade products from Release 10.7 (NCA, SC and character-mode) or Release 11 of Oracle Applications. This manual also contains an overview chapter that describes all the tasks necessary to prepare and complete a upgrade of Oracle Applications.

Oracle Applications System Administrator's Guide

This manual provides planning and reference information for the Oracle Applications System Administrator. It contains information on how to define security, customize menus and manage concurrent processing.

Oracle Applications Product Update Notes

This book contains a summary of each new feature we added since Release 11, as well as information about database changes and seed data changes that may affect your operations or any custom reports you have written. If you are upgrading from Release 10.7 you also need to read *Oracle Applications Product Update Notes Release 11*.

Oracle Self-Service Web Applications Implementation Manual

This manual describes the setup steps for Oracle Self-Service Web Applications and the Web Applications Dictionary.

Oracle Applications Implementation Wizard User Guide

If you are implementing more than one Oracle product, you can use the Oracle Applications Implementation Wizard to coordinate your setup activities. This guide describes how to use the wizard.

Other Information

Training

Oracle Education offers a complete set of training courses to help you and your staff master Oracle Applications. We can help you develop a training plan that provides thorough training for both your project team and your end users. We will work with you to organize courses appropriate to your job or area of responsibility.

Training professionals can show you how to plan your training throughout the implementation process so that the right amount of information is delivered to key people when they need it the most. You can attend courses at any one of our many Educational Centers, or you can arrange for our trainers to teach at your facility. In addition, we can tailor standard courses or develop custom courses to meet your needs.

Support

From on-site support to central support, our team of experienced professionals provides the help and information you need to keep Oracle Bills of Material working for you. This team includes your Technical Representative, Account Manager, and Oracle's large staff of consultants and support specialists with expertise in your business

Oracle Proprietary, Confidential Information--Use Restricted by Contract

area, managing an Oracle server, and your hardware and software environment.

About Oracle

Oracle Corporation develops and markets an integrated line of software products for database management, applications development, decision support, and office automation, as well as Oracle Applications, an integrated suite of more than 75 software modules for financial management, supply chain management, manufacturing, project systems, human resources, and sales and service management.

Oracle products are available for mainframes, minicomputers, personal computers, network computers, and personal digital assistants, allowing organizations to integrate different computers, different operating systems, different networks, and even different database management systems, into a single, unified computing and information resource.

Oracle is the world's leading supplier of software for information management, and the world's second largest software company. Oracle offers its database, tools, and applications products, along with related consulting, education, and support services, in over 145 countries around the world.

Thank You

Thanks for using Oracle Bills of Material and this technical reference manual!

We appreciate your comments and feedback. At the back of this manual is a Reader's Comment Form that you can use to explain what you like or dislike about Oracle Bills of Material or this technical reference manual. Mail your comments to the following address or call us directly at (650) 506-7000.

High-Level Design

This chapter presents a high-level design for Oracle Bills of Material that satisfies the business needs we specify during Strategy and Analysis. It contains database diagrams for Oracle Bills of Material application building blocks, lists of database tables and views, and a list of modules.

Overview of High-Level Design

During High-Level Design, we define the application components (tables, views, and modules) we need to build our application. We specify what application components should do without specifying the details of *how* they should do it.

You can refer to this High-Level Design chapter to quickly acquaint yourself with the tables, views, and modules that comprise Oracle Bills of Material applications. And, you can prepare yourself to understand the detailed design and implementation of Oracle Bills of Material.

Summary Database Diagram

The Summary Database Diagram section graphically represents the most important application tables and the relationships between them. It omits tables and relationships that contribute little to the understanding of the application data model. Typically, a summary database diagram shows tables that contain key reference and transaction data.

We prepare a summary database diagram to describe, at a conceptual level, the key information on which our business depends. Later, we refine this summary database diagram, breaking it into multiple database diagrams (generally, one per application building block) to represent all the tables and relationships we need to implement our application in the database.

Review the Summary Database Diagram section to see at a glance the major tables and relationships on which your Oracle Bills of Material application depends.

Database Diagrams

The Database Diagrams section graphically represents all Oracle Bills of Material applications tables and the relationships between them, organized by building block.

Use this section to quickly learn what tables each Oracle Bills of Material application building block uses, and how those tables interrelate. Then, you can refer to the Table and View Definitions sections of Chapter 3 for more detailed information about each of those tables.

Oracle Proprietary, Confidential Information--Use Restricted by Contract

Table Lists

The Table List sections list the Oracle Bills of Material applications tables. Because a product might not include at least one table for each type, this Technical Reference Manual might not include each of the following sections.

Public Tables

Use the Public Table List section to quickly identify the tables you are most interested in. Then, you can refer to the Table and View Definitions sections of Chapter 3 for more detailed information about those tables.

In addition, this manual may contain full documentation for one or more of the following Application Object Library tables: FND_DUAL, FND_CURRENCIES, and FND_COMMON_LOOKUPS.

Internal Tables

This section includes a list of private, internal tables used by Oracle Bills of Material; we do not provide additional documentation for these tables.

View Lists

The View List sections list the Oracle Bills of Material views, with one section for each type of view. Because a product might not include at least one view for each type, this Technical Reference Manual might not include each of the following sections.

Use this section to quickly identify the views you are most interested in. Then, you can refer to the Table and View Definitions sections of Chapter 3 for more detailed information about those views.

Public Views

This section lists views that may be useful for your custom reporting or other data requirements. The list includes a description of the view, and the page in Chapter 3 that gives detailed information about the public view.

Web Views

This section lists views that you may need to configure your Self-Service Web applications. The list includes a description of the view, and the page in Chapter 3 that gives detailed information about the web view.

Internal Views

This section includes each private, internal view that Oracle Bills of Material uses.

Multiple Reporting Currency Views

This list includes views that were created to support the Multiple Reporting Currencies feature.

Module List

The Module List section briefly describes each of the Oracle Bills of Material applications modules. This section lists forms, reports, and concurrent programs.

A form is a module comprised of closely related windows that are used together to perform a task. For example, the Enter Journals form in Oracle General Ledger includes the Enter Journals window, the Batch window, and the More Actions window. The Enter Journals window is the main window, and from it, you can use buttons to navigate to other windows in the form. The form name usually corresponds to the main window in the form, and is frequently a window you can open directly from the Navigator.

The Reports and Concurrent Programs lists include processes you can submit from the Submit Requests window or other windows, as well as processes that are submitted automatically by Oracle Bills of Material. Use your user guide to learn more about reports and concurrent processes.

Database Diagramming Conventions

We use the following notational conventions in our database diagrams:

Figure 2 – 1
Database Diagram
Conventions

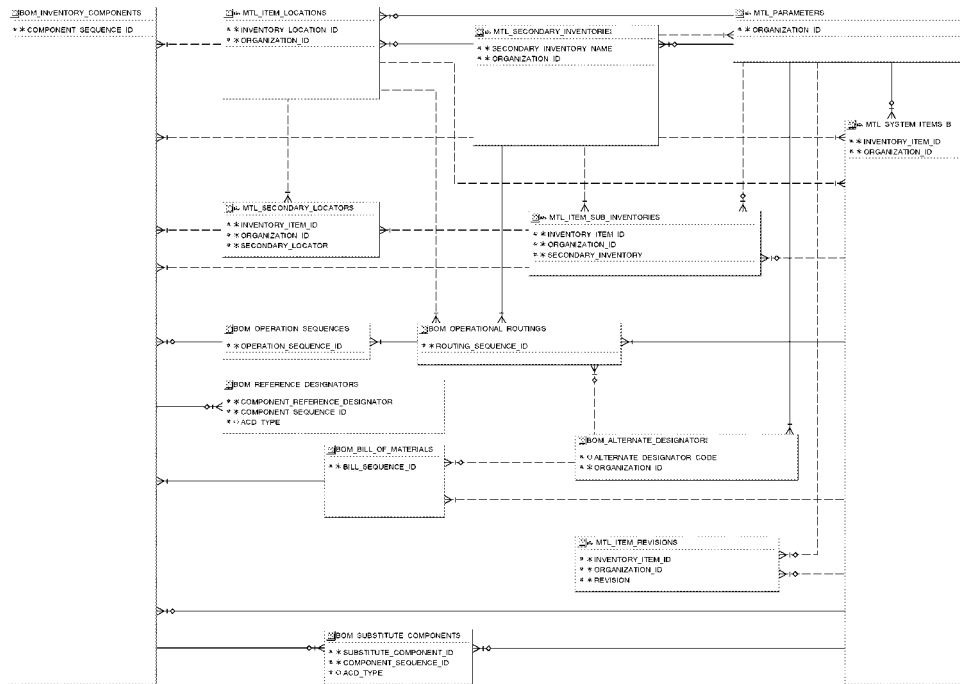

Tables – are the basic unit of storage in the database. A hand symbol preceding the title in the table's title bar indicates that the table is not owned by this application but shared with another.

Foreign key constraint – is a type of referential integrity constraint for checking the integrity of data entered in a specific column or set of columns. This specified column or set of columns is known as the foreign key.

Delete rule indicator – determines the action to be taken when an attempt is made to delete a related row in a join table. A line through the foreign key constraint, as shown on the above diagram, indicates that this action is restricted.

Arcs – specify that, for any given row in a table, a value must be entered in one of the arc columns. The remaining columns within the arc must be null.

Database Diagrams

This section graphically represents all Oracle Bills of Material tables and the relationships between them, organized by building block. Use this section to quickly learn what tables each Oracle Bills of Material application building block uses, and how these tables interrelate. Then, you can refer to the Table and View Definitions sections of Chapter 3 for more detailed information about each of those tables.

This section contains a database diagram for each of the following Oracle Bills of Material application building blocks:

- Diagram 1: Average Cost Overview
- Diagram 2: Cost Information
- Diagram 3: Cost Detail
- Diagram 4: Periodic Distributions and IPV
- Diagram 5: Periodic Cost Overview
- Diagram 6: Standard Cost Overview
- Diagram 7: Bill of Material Structures
- Diagram 8: Bills of Material Scheduling Overview
- Diagram 9: Routings
- Diagram 10: Deletes
- Diagram 11: Engineering Change Order

Some tables, especially important reference tables, appear in more than one database diagram. When several building blocks use a table, we show that table in each appropriate database diagram.

Average Cost Overview

This diagram shows the tables and relationships that support average costing in Oracle Cost Management. Oracle Work in Process tables are also included to show how Work in Process uses average costing.

Cost Information

This diagram shows the tables and relationships that support item and resource cost information. All costs reference a cost type, sub-element and optionally reference an activity.

Cost Detail

This diagram shows how Oracle Cost Management accesses, stores, and processes cost information in Oracle Manufacturing. The tables and relationships displayed include bill, routing, resource and item cost information.

Periodic Distributions and IPV

This diagram includes tables and relationships that support IPV and accounting distributions for periodic costing. The relationships adhere to the SLA architecture for accounting. It gives an overview of the integration of Oracle Cost Management with Oracle Purchasing and Oracle Payables.

Periodic Cost Overview

This diagram shows the tables and relationships that support periodic costing in Oracle Cost Management. This functionality is new to Release 11*i*. The Oracle Inventory and Oracle Work in Process tables

have also been included to give a complete overview of the periodic costing functionality.

Standard Cost Overview

This diagram shows the tables and relationships that support standard costing in Oracle Cost Management.

Bill of Material Structures

This diagram shows the tables and relationships that hold manufacturing bill of material information. These tables support the definition and maintenance of any type of bill of material– including planning, model, option class, and standard bills.

Bills of Material Scheduling Overview

This diagram shows the tables and relationships that hold department and resource availability information. These tables support the definition of a manufacturing calendar, department, resources, and shifts. Oracle Shop Floor Management, Oracle Work in Process, Oracle Master Scheduling/MRP, Oracle Capacity, and Oracle Inventory use this department and resource availability information to forecast, plan, and schedule material and resource requirements.

Routings

This diagram shows the tables and relationships that hold manufacturing routing information. These tables support the definition and maintenance of all routing information– including operation, resource, usage, and cost details.

Deletes

This diagram shows the tables and relationships that support deleting item information. This includes item, bill of material, component, routing, and operation deletions.

Engineering Change Order

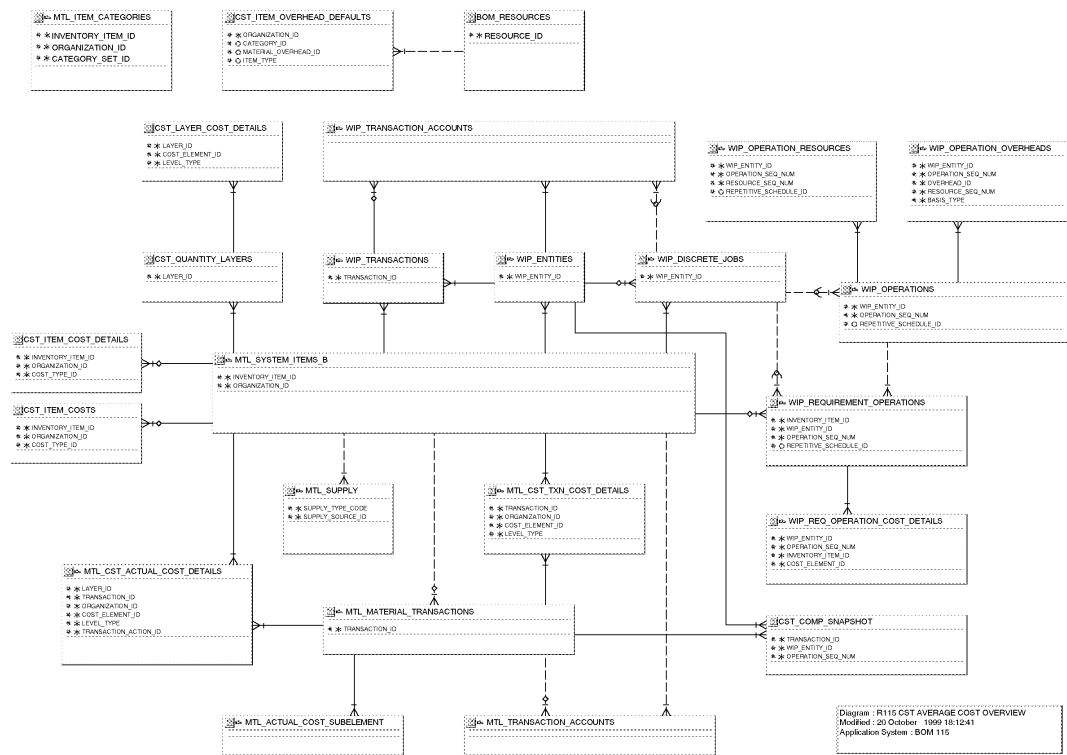

This diagram shows the tables and relationships that contain Engineering Change Order information. It reveals how revised items can be implemented as ECO revisions through the ECO approval process.

How to Use These Database Diagrams

Here is an example of how you might use these database diagrams:

Suppose you want to write a custom application to interface your Oracle Bills of Material application with your non-Oracle routing system. You want to see how your Oracle Bills of Material application defines a routing for an item. You turn to the Routing Diagram to see the table structure for assembling an item using a bill of material. You learn that components for any item can have a primary and alternate routing. Moreover, you can see that routings for an item can be defined as a common routing for another assembly item and that routings are composed of operation sequences. Next, turn to the Table Definitions section in Chapter 3 to learn about the columns in each of these tables to facilitate the integration of your data.

Public Table List

This section lists each public database table that Oracle Bills of Material uses and provides a brief description of each of those tables. The page reference is to the table description in Chapter 3.

Note that "public" tables are not necessarily intended for write access by custom code; Oracle Corporation supports write access using only standard Oracle Applications forms, reports, and programs, or any SQL write access to tables explicitly documented as API tables. For more information, see the How Not To Use This Manual section of this book's Introduction.

Oracle Bills of Material uses the following Public tables:

| Table Name | Description |
|---------------------------|---|
| ACTIVITY_COSTS | (See page 3 – 7) |
| AK_ATTRIBUTES | Attribute name, properties and the application ID which define an attribute (See page 3 – 8) |
| AK_ATTRIBUTES_TL | Translations for AK_ATTRIBUTES (See page 3 – 10) |
| AK_EXCLUDED_ITEMS | List of secured attributes that should be hidden from a user based on their responsibility id (See page 3 – 11) |
| AK_FLOWS | Defines a flow and associates a primary page to a flow (See page 3 – 12) |
| AK_FLOWS_TL | Translations for AK_FLOWS (See page 3 – 13) |
| AK_FLOW_PAGES | Links a page to a flow and defines the primary region for each page (See page 3 – 14) |
| AK_FLOW_PAGES_TL | Translations for AK_FLOW_PAGES (See page 3 – 16) |
| AK_FLOW_PAGE_REGIONS | Links a region to a page (See page 3 – 17) |
| AK_FLOW_PAGE_REGION_ITEMS | Links a region item to a region (See page 3 – 19) |
| AK_FLOW_REGION_RELATIONS | Links two page regions together by a foreign key (See page 3 – 21) |
| AK_FOREIGN_KEYS | Foreign keys for an object (See page 3 – 23) |
| AK_FOREIGN_KEYS_TL | Translations for AK_FOREIGN_KEYS (See page 3 – 24) |
| AK_FOREIGN_KEY_COLUMNS | Links an attribute to a foreign key (See page 3 – 25) |

Single Organization View List

Multi–Organization Support is a feature that allows you to implement multiple sets of books within a single installation of Oracle Payables, Oracle Receivables, Oracle Purchasing, and Oracle Order Entry/Shipping. Instead of using multiple installations to provide data security, data is secured by operating unit.

In Release 10.7, we added a column, `ORG_ID`, to each base table that requires “partitioning” by operating unit, including all transaction tables and many reference tables, then renamed these tables to end with the suffix `_ALL`. Then, to take the place of the renamed table, we create a view (named like the Release 10.6 or earlier table) containing a `WHERE` clause that automatically restricts data to a single operating unit. The `WHERE` clause relies upon the value of an Oracle global variable to indicate the current organization.

If you want to retrieve all information, regardless of operating unit, query the `_ALL` table. For example, if you are running a cross–organization report, you probably want to query the `_ALL` table.

However, if you want to report against only a single organization or operating unit, query the corresponding cross–organizational view, using the familiar 10.6–style table name. The view definition will automatically retrieve only data for your current operating unit.

Detailed Design

This chapter presents a detailed design for implementing Oracle Bills of Material. It contains detailed definitions of tables and views that you may need to reference to write custom reports or use for other data extraction.

Overview of Detailed Design

During Detailed Design, we specify in detail how each applications component should work. We prepare detailed definitions of tables and views.

You can refer to this Detailed Design chapter to gain a detailed understanding of the underlying structure and processing of Oracle Bills of Material that enables you to:

- Convert existing application data
- Integrate your Oracle Bills of Material application with your other applications systems
- Write custom reports
- Define alerts against Oracle Applications tables
- Create views for decision support queries using query tools
- Configure your Oracle Self-Service Web Applications

Table and View Definitions

The Table and View Definitions section contains a detailed definition of Oracle Bills of Material applications tables. For each table, it provides information about primary keys, foreign keys, QuickCodes, indexes, triggers, and sequences. It also gives you a detailed description of each column and its characteristics. In addition, it provides the SQL statement that defines each view. Review this section to get a detailed understanding of what tables your Oracle Bills of Material application contains, and how it uses them to hold and access the information it needs.

Table and View Definitions

This section contains a detailed description of each Oracle Bills of Material table and view that you may need to reference. For each table, it presents detailed information about:

- Primary keys
- Foreign keys
- Column descriptions
- Indexes
- Oracle sequences
- Triggers
- View derivations

Because Oracle does not support customization of Oracle Application Object Library tables, we do not provide you with detailed information about them. Consequently, this section does not document all the FND_% tables Oracle Bills of Material uses.

The following sections appear in each table or view description:

Foreign Keys

To help you understand the relationships between tables, we list each foreign key contained in a table. For each foreign key in a table, we list the primary key table name (the table to which a foreign key refers), its corresponding primary key columns, and the foreign key columns that refer to those primary key columns.

When the primary key table has a composite primary key, we list each column of the composite key sequentially.

If a table contains two or more distinct foreign keys that refer to the same primary key table, we repeat the primary key table name and list each of the distinct foreign keys separately.

QuickCodes Columns

When a database column contains a QuickCodes value, which we implement using a foreign key to FND_LOOKUPS, MFG_LOOKUPS, or to some other lookup table, we list the QuickCodes type (lookup

Oracle Proprietary, Confidential Information--Use Restricted by Contract

type) to which the QuickCodes value must belong and a complete list of QuickCodes values and meanings. Some QuickCodes can be defined by you in the application. These values are designated as User-defined.

Column Descriptions

We list the important characteristics of each column in a table or view. These characteristics include whether the column is part of the table's primary key, whether Oracle8i requires a value for this column, and the data type of the column. We also give you a brief description of how Oracle Bills of Material uses the column.

When a column is part of a table's primary key, we append the notation (PK) to the name of that column.

To help you understand which columns Oracle Bills of Material uses and which columns it does not use, we alert you to any unused column. When no module uses a database column, we show one of the following legends in the Description column:

| | |
|----------------------------|--|
| Not currently used | Oracle Bills of Material does not use this column, although the column might be used in a future release. |
| No longer used | Oracle Bills of Material no longer uses this column. AutoInstall installs this column. Subsequent versions of Oracle Bills of Material might not include this column. |
| No longer installed | Oracle Bills of Material no longer uses this column. If you <i>upgraded</i> your software from an earlier version, you may still have this column, depending upon whether you chose to delete it during an upgrade process. If you <i>install</i> Oracle Bills of Material, you do not have this column. |

Standard Who Columns

Most Oracle Bills of Material tables contain standard columns to support \ **Row Who**. When your program or SQL*Plus command selects a row from a table, use these columns to determine who last updated the row. If your program or SQL*Plus command updates or

inserts a row in an interface table, you must populate each of the five standard Who columns:

| | |
|--------------------------|--|
| LAST_UPDATE_DATE | Date when a user last updated this row |
| LAST_UPDATED_BY | User who last updated this row (foreign key to FND_USER.USER_ID) |
| CREATION_DATE | Date when this row was created |
| CREATED_BY | User who created this row (foreign key to FND_USER.USER_ID) |
| LAST_UPDATE_LOGIN | Operating system login of user who last updated this row (foreign key to FND_LOGINS.LOGIN_ID). You should set this to NULL, or to 0 if NULL is not allowed |

Since every table containing Who columns has several foreign keys to the tables FND_USER and FND_LOGINS, we do not include the foreign key columns LAST_UPDATED_BY, CREATED_BY, or LAST_UPDATE_LOGIN in a table's list of foreign keys.

Additional Who Columns for Concurrent Programs

Some Oracle Bills of Material tables also contain several additional Who columns to distinguish between changes a user makes with a form and changes a concurrent program makes. When a concurrent program updates or inserts a row in a table, the concurrent program populates the following additional Who columns:

| | |
|-------------------------------|---|
| REQUEST_ID | Concurrent request ID of program that last updated this row (foreign key to FND_CONCURRENT_REQUESTS.REQUEST_ID) |
| PROGRAM_APPLICATION_ID | Application ID of program that last updated this row (foreign key to FND_APPLICATION.APPLICATION_ID) |
| PROGRAM_ID | Program ID of program that last updated this row (foreign key to FND_CONCURRENT_PROGRAM.CONCURRENT_PROGRAM_ID) |
| PROGRAM_UPDATE_DATE | Date when a program last updated this row |

Since every table containing these additional Who columns has several foreign keys to the tables FND_CONCURRENT_REQUESTS, FND_APPLICATION, and FND_CONCURRENT_PROGRAM, we do not include the foreign key columns REQUEST_ID, PROGRAM_APPLICATION_ID, or PROGRAM_ID in a table's list of foreign keys.

Indexes

If an Oracle Bills of Material table uses an Oracle8i index, we list the database columns that comprise that index, in sequential order.

Note: The indexes we document in this manual correspond to unique keys we specified during product development and testing. In some cases, we may add additional indexes during the porting process to fine-tune performance on specific platforms; therefore, there may be minor differences between the indexes documented in this book and the indexes for production versions of Oracle Bills of Material.

Sequences

Oracle Bills of Material uses Oracle8i sequence generators to generate unique integers. If any table column gets its value from an Oracle8i sequence generator, we list the name of the corresponding sequence generator and the name of the column that stores the unique integer.

Database Triggers

If a table has one or more active database triggers, we provide a brief explanation of each database trigger and when it fires.

View Derivation

For each Oracle Bills of Material view you may need to reference, we include important elements from the SQL statement that defines or creates a view. By studying this view definition, you can understand exactly how a view derives its contents.

AK_ATTRIBUTES_TL

AK_ATTRIBUTES_TL stores translated information about the attributes in AK_ATTRIBUTES. Each row includes the language the row is translated to, the name, description, and label of the attribute, and the attribute identifier which uniquely identifies the attribute. You need one row for each attribute in each of the installed languages. Each row includes a language and SOURCE_LANG column which can be used to determine if a value has been translated or defaulted.

AK_EXCLUDED_ITEMS

AK_EXCLUDED_ITEMS contains attributes which should be hidden from users based on their responsibility ID. You need one row for each attribute that you want hidden for a specific responsibility. AK_QUERY_PKG currently makes use of this table and it returns the attribute and attribute's value. AK_QUERY_PKG also sets a flag (SECURED_COLUMN=Y) to inform the developer that this attribute (or column) should be secured (hidden) from the current user.

AK_FLOW_REGION_RELATIONS

AK_FLOW_REGION_RELATIONS defines the foreign key relationship between two flow page regions. You will need one row for each relationship that you want to create.

Each relationship must specify the flow, the "From" (parent) page region, the "To" (child) page region and the foreign key that links the "From" (parent) page region to the "To" (child) page region.

AK_FOREIGN_KEYS

AK_FOREIGN_KEYS defines the foreign keys that belong to an object. You must create one row for each foreign key you wish to associate to an object.

For each foreign key, you must specify the database object name, unique (primary) key name and the application owner of the foreign key.

AK_FOREIGN_KEYS_TL

AK_FOREIGN_KEYS_TL stores translated information about the foreign keys in AK_FOREIGN_KEYS. Each row includes the language the row is translated to, the attributes for the foreign key and the foreign key identifier which uniquely identifies the foreign key. You need one row for each foreign key in the installed languages. Each row includes a language and SOURCE_LANG column which can be used to determine if a value has been translated or defaulted.

AK_LOADER_TEMP

AK_LOADER_TEMP functions as a temporary buffer table for the AK Java loader program.

When the AK Java loader uploads a flat file from disk to the database, each line in the flat file is read by the Java program and copied to this table. The AK loader PL/SQL procedures read this table and perform the database upload.

When the AK Java loader downloads information from the database, each row in this table is first populated by the AK loader PL/SQL procedures. The AK Java loader program then reads each row from this table and creates a flat file on the local file system.

Column Descriptions

| Name | Null? | Type | Description |
|--------------|----------|----------------|---|
| TBL_INDEX | NOT NULL | NUMBER(15) | Record number(index) in this table |
| LINE_CONTENT | NULL | VARCHAR2(2000) | A copy of a row from the loader flat file |

AK_LOOKUP_CODES

AK_LOOKUP_CODES contains lookup code, lookup type and description of each lookup codes. It also contains translation information for the description of lookup code. You need one row for each lookup code/type that you want.

Column Descriptions

| Name | Null? | Type | Description |
|-------------------|----------|--------------|--|
| LOOKUP_CODE (PK) | NOT NULL | VARCHAR2(25) | Name of the lookup code |
| LOOKUP_TYPE (PK) | NOT NULL | VARCHAR2(30) | Defines the type of lookup code |

AK_MULTIORG_VALIDATION_TEMP

This is a temporary validation table used by the Multi-Org Validation Report.

Column Descriptions

| Name | Null? | Type | Description |
|--------------------------|-------|---------------|---|
| CODE | NULL | VARCHAR2(5) | Validation entity identifier |
| ORGANIZATION_ID | NULL | NUMBER(22) | Identifier of the organization for which the report is being run. |

| PROFILE_LEVEL | NULL | VARCHAR2(80) | Profile level for this validation |
| PROFILE_OPTION_VALUE | NULL | VARCHAR2(240) | Profile value for this validation |

AK_OBJECTS

AK_OBJECTS contains database object name and the owner (application id) of the database object name. You need one row for each object that you want to define.

An object is a logical representation of a database view. The database object name is the name of a view in the database. Thus, there can only be one AK_OBJECTS per view. This view must exist in FND_VIEW or ALL_VIEWS.

You must specify a unique key name for each database object name.

AK_OBJECT_ATTRIBUTE_NAVIGATION

AK_OBJECT_ATTRIBUTE_NAVIGATION is used only by Configurator (CZ). This table provides navigation to a region by attribute value. You need to create one row for each object attribute value that will allow navigation to a region.

You must specify a target "To" region for each object attribute value. If at run time, the object attributes value entered by the user matches a row in this table, the user will have access to the target region associated with this object attribute value.

AK_OBJECT_VALUES_TEMP is used to create the LOV for the Value field on the Run Flows form. The lov for the Value field calls a package called AK_RUN_FLOW_PKG which uses this table to store the results from running AK_QUERY_PKG.EXEC_QUERY.

This table should never be populated by any user.

AK_REGIONS

AK_REGIONS contains regions and the application owner of the region. A region contains a set of items that may be returned by AK_QUERY_PKG. You need to one row for each region.

Each row must include a database object name and a region style. You can also specify the number of columns that are to be displayed on the region as well as an URL for the region.

AK_REGION_ITEMS

AK_REGION_ITEMS defines the item (attribute or object attribute) on a region. An item is a single attribute or object attribute that exists on a region. You will need one row for each item you want to assign to a region.

You must define formatting properties (i.e., ATTRIBUTE_LABEL_LENGTH, BOLD, ITALIC, VERTICAL_ALIGNMENT, etc.) for each item. You must also specify if the item is an attribute or object attribute with the OBJECT_ATTRIBUTE_FLAG. This table also allows you to specify other properties for the item.

AK_REGION_ITEMS_TL

AK_REGION_ITEMS_TL stores translated information about the region items in AK_REGION_ITEMS. Each row includes the language the row is translated to, the translated attributes of the region item, the region identifier which uniquely identifies the region item and the region items label. You need one row for each region item in each of the installed languages. Each row includes a language and SOURCE_LANG column which can be used to determine if a value has been translated or defaulted.

AK_RESP_SECURITY_ATTRIBUTES

AK_RESP_SECURITY_ATTRIBUTES contains attributes that are displayed or hidden from a user based on the user's responsibility ID. You need one row for each attribute/responsibility ID combination.

AK_QUERY_PKG uses this table in conjunction with the AK_WEB_USER_SEC_ATTR_VALUES table (please see this description for more details). Together, both tables defines what attributes a user may or may not see.

AK_UNIQUE_KEYS

AK_UNIQUE_KEYS defines the unique keys that belong to an object. You must create one row for each unique key you wish to associate to an object. Generally the unique key is the primary key of a view, though some views may have additional unique keys.

For each unique key, you must specify the database object name, unique key name and the application owner of the unique key.

AK_WEB_USER_SEC_ATTR_VALUES

AK_WEB_USER_SEC_ATTR_VALUES contains user IDs, attributes and attributes values that define if an attribute is secure for a specific user. You need one row for each user/attribute/value that you want to secure.

AK_QUERY_PKG uses this table in conjunction with the AK_RESP_SECURITY_ATTRIBUTES table. Together, both tables dictates to AK_QUERY_PKG what rows should be returned.

AP_INVOICE_DISTRIBUTIONS_ALL

AP_INVOICE_DISTRIBUTIONS_ALL holds the distribution line information that you enter for invoices. There is a row for each invoice distribution. A distribution line must be associated with an invoice. An invoice can have multiple distribution lines.

Your Oracle Payables application automatically creates rows in this table when: 1) you choose a distribution set at the invoice level 2) you import expense reports 3) you match an invoice to a purchase order or receipt; it uses information from the matched purchase order or receipt 4) you import invoices via the Open Interface Import process 5) you select to automatically calculate tax 6) you select to automatically do withholding.

Each invoice distribution line has its own accounting date. When you account for an invoice, your Oracle Payables application creates accounting events, accounting entry headers and accounting entry lines for those distribution lines that have accounting dates included in the selected accounting date range for the Payables Accounting Process. The accounting entries can then be transferred over to General Ledger by running the Transfer to General Ledger process which creates journal entries.

Values for POSTED_FLAG may be Y for accounted distributions or N for distributions that have not been accounted. Values for ACCRUAL_POSTED_FLAG may be Y if distribution has been accounted and system is setup for accrual basis accounting or N if either distribution has not been accounted or accrual basis accounting is not used.

Values for CASH_POSTED_FLAG may be Y if distribution has been accounted and system is set up for cash basis accounting, N if either distribution has not been accounted or system is not setup for cash basis accounting or P if distribution has been partially accounted in the cash set of books.

The MATCH_STATUS_FLAG indicates the approval status for the distribution. Values for the MATCH_STATUS_FLAG can be null or N for invoice distributions that Approval has not tested or T for distributions that have been tested or A for distributions that have been tested and approved.

Invoice distributions may be interfaced over/from Oracle Assets or Oracle Projects. Your Oracle Payables application sets the

Oracle Proprietary, Confidential Information--Use Restricted by Contract

ASSETS_ADDITION_FLAG to U for distributions not tested by Oracle Assets; Oracle Assets then adjusts this flag after it tests a distribution for assignment as an asset. To avoid the same invoice distribution being interfaced to both Oracle Projects and Oracle Assets, you must interface any project-related invoice distribution to Oracle Projects before you can interface it to Oracle Assets. If the project-related invoice distribution is charged to a capital project in Oracle Projects, Oracle Projects sets the ASSET_ADDITION_FLAG to P when the PA_ADDITION_FLAG is set to Y, Z or T. Oracle Assets only picks up invoice distributions with the ASSET_ADDITION_FLAG set to U and if project-related, with the PA_ADDITION_FLAG set to Y, Z, or T. PA_ADDITION_FLAG tracks the status of project-related supplier invoice distribution lines and expense report distribution lines. For supplier invoice distributions entered via Oracle Payables, the PA_ADDITION_FLAG is set to N if the distribution is project-related, otherwise it is set to E and it is updated by Oracle Projects when the distribution is processed by the Oracle Projects Interface Supplier Invoice process. Oracle Projects sets the PA_ADDITION_FLAG to Y or Z after the item is successfully processed, or may be set to a rejection code if the line is rejected during transfer to Oracle Projects; see QuickCodes listing for all the errors. You must correct the rejection reason and try to retransfer the line. For supplier invoice adjustment lines interfaced from Oracle Projects to Oracle Payables (which must net to zero with another line), the value for the PA_ADDITION_FLAG is set to T. For expense report distributions interfaced from Oracle Projects to Oracle Payables via Invoice Import, this value is set to N. This row is never picked up by the Interface Supplier Invoices process based on the AP_INVOICES.INVOICE_TYPE_LOOKUP_CODE = EXPENSE REPORT. For expense report adjustment lines interfaced from Oracle Projects to Oracle Payables which net to zero with another line, this value is set to T. Both lines are associated with the original invoice by the Oracle Projects Interface Expense Reports to AP process.

Values for the ENCUMBERED_FLAG are as follows: Y indicates a regular distribution that has been successfully encumbered by Payables; W indicates a regular distribution that has been encumbered in advisory mode even though insufficient funds existed; H indicates a regular distribution that has not been encumbered because it was put on hold; N or null indicates a regular line that has not been encumbered because it has not been looked at yet; D is the same as Y for a reversal distribution line; X is the same as W for a reversal distribution line; P is the same as H for a reversal distribution line; R indicates a line to be ignored by encumbrance and approval code because neither the original nor the reversal distributions were looked at and they offset each other so, they can be ignored.

This table corresponds to the Distributions window.

Database Triggers

Trigger Name : AX_AP_INVOICE_DIST_ARU1
Trigger Time : AFTER
Trigger Level : ROW
Trigger Event : UPDATE

This trigger captures information needed to create subledger accounting events when Oracle Payables and the set of books used is defined as a subledger in the Global Accounting Engine application. This trigger may insert/update/delete rows in the AX_DOCUMENT_STATUSES and AX_EVENTS tables. This trigger captures accounting events related to Oracle Payables invoices. It fires right after each invoice distribution line?s matching status, accrual posting flag, or accounting date is changed.

Oracle Proprietary, Confidential Information--Use Restricted by Contract

Trigger Name : AX_AP_INVOICE_DIST_ARDI1
Trigger Time : AFTER
Trigger Level : ROW
Trigger Event : INSERT, DELETE

This trigger captures information needed to create subledger accounting events when Oracle Payables and the set of books used is defined as a subledger in the Global Accounting Engine application. This trigger may insert/update/delete rows in the AX_DOCUMENT_STATUSES and AX_EVENTS tables. This trigger captures accounting events related to Oracle Payables invoices. It fires right after each invoice distribution line is created or deleted.

Trigger Name : AP_MRC_INVOICE_DISTIS_BIUD
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : INSERT, UPDATE, DELETE

This MRC trigger exists only when you install the Multiple Reporting Currencies feature. It is executed when you perform an insert, update, or delete statement on the table AP_INVOICE_DISTRIBUTIONS_ALL.

For each record being inserted/updated/deleted in AP_INVOICE_DISTRIBUTIONS_ALL, this trigger inserts/updates/deletes corresponding reporting currency records in the MRC subtable, AP_MC_INVOICE_DISTIS. In addition, this trigger also populates the MRC VARCHAR2 columns in AP_INVOICE_DISTRIBUTIONS_ALL.

Trigger Name : JL_BR_AP_TAX_HOLDS
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : UPDATE

This trigger prevents Payables from automatically creating "Tax Variance" and "Tax Amount Range" holds when Brazilian taxes exist.

This trigger is installed and active only if Latin American Localizations have been installed.

The validation is performed when the current country is Brazil.

AP_TAX_CODES_ALL

AP_TAX_CODES_ALL contains information about the tax codes you define. You need one row for each tax code you want to use when entering invoices. When you enter invoices, you can use a list of values to select a tax code defined in this table. Your Oracle Payables application also uses TAX_RATE to calculate use tax when you enter a taxable amount for an invoice.

This table corresponds to the Tax Names window.

BOM_ALTERNATE_DESIGNATORS

BOM_ALTERNATE_DESIGNATORS stores the alternate designators that you use to define alternate bills of material and routings.

You cannot use the alternate designator to define an alternate bill or routing after its DISABLE_DATE.

BOM_ATO_CONFIGURATIONS

BOM_ATO_CONFIGURATIONS stores information about configuration items. Each configuration item is associated with a base model and has a list of options and option classes chosen for the configuration. It also contains the quantities of components per configuration item. The last referenced date indicates the most recent date on which a duplicate configuration was found by the AutoCreate Configuration program.

BOM_BILL_OF_MATERIALS

BOM_BILL_OF_MATERIALS stores information about manufacturing and engineering bills of material. Each row in this table represents a unique manufacturing or engineering bill and is identified by BILL_SEQUENCE_ID.

Oracle Bills of Material stores planning bills, model/option structures and standard bills in this table. The item's BOM_ITEM_TYPE attribute dictates the type of bill of material defined in this table. There is no identifier in this table that differentiates planning, model, option class, standard bills or product families.

If a bill shares its structure with another bill in the same or a different organization, COMMON_BILL_SEQUENCE_ID refers to that common bill. This is a mandatory column that equals BILL_SEQUENCE_ID if there is no common bill reference.

If an engineering change order creates a new bill of material for an item, PENDING_FROM_ECN stores the ECO number that originates this new bill.

Database Triggers

Trigger Name : BOMTBOMX
Trigger Time : AFTER
Trigger Level : ROW
Trigger Event : INSERT, UPDATE, DELETE

This trigger updates the REXPLODE_FLAG in the BOM_EXPLOSIONS table for the INSERT, UPDATE or DELETE of a row. For a product family this trigger nulls out the PRODUCT_FAMILY_ITEM_ID column in the MTL_SYSTEM_ITEMS table for DELETES.

BOM_BILL_OF_MATERIALS_ARCHIVE

Used by Delete Group program to archive deleted Bills of Material.

BOM_BILL_OF_MTLS_INTERFACE

BOM_BILL_OF_MTLS_INTERFACE temporarily stores bills of material before loading information into Oracle Bills of Material. This table contains user friendly columns which allow you to easily enter your data as well as their corresponding foreign keys. Oracle Bills of Material will derive column values you do not enter, after performing the proper validation. For example, you enter the ORGANIZATION_CODE and Oracle Bills of Material will fill in the corresponding ORGANIZATION_ID for you.

Also, if you enter REVISION, Oracle Bills of Material will insert a record into MTL_ITEM_REVISIONS for your bill item.

BOM_CALEDNARS

BOM_CALEDNARS stores the definition of your workday calendar.

You can follow any of the four following type of quarters for your yearly calendar identified by Quarterly Calendar Type

1. 4-4-5 : quarterly pattern having two 4 weeks followed by a 5 week period
2. 5-4-4 : one 5 week followed by two 4 week periods
3. 13 periods : for calendar year
4. regular months of calendar year

BOM_CALENDAR_DATES

BOM_CALENDAR_DATES stores data compiled by the workday calendar for the base calendar. This table stores every date between the calendar start date and calendar end date for the given calendar using a specified exception set.

The workday calendar program sequences each work day for the calendar, starting with 1. Non-working days have NULL values for SEQ_NUM. PRIOR_SEQ_NUM and NEXT_SEQ_NUM point to the previous and next workdays. For rows that represent workdays, prior equals next. For non-working days prior points to previous workday and next points to next workday.

BOM_CALENDAR_SHIFTS

BOM_CALENDAR_SHIFTS stores the shift information that you define for a calendar (CALENDAR_CODE). You define each shift (SHIFT_NUM), its description (DESCRIPTION), and shift workday pattern (DAYS ON and DAYS OFF). A calendar can have multiple shifts, each having its own workday pattern and exception dates. Each shift also has its own shift times. The workday calendar program generates a shift calendar for every shift you define.

BOM_CAL_WEEK_START_DATES

BOM_CAL_WEEK_START_DATES stores all the weeks between the calendar start date and calendar end date for a calendar and exception set. All calendar week start dates are valid work days. A sequence is generated beginning from the first week start date. The next week start date and prior week start date are also stored in this table.

BOM_COMPARISON_TEMP

BOM_COMPARISON_TEMP stores information about a comparison of two bills of material. This table is used by both Oracle Bills of Material and Oracle Engineering for the View Bill of Material Comparison window and the Bill of Material Comparison report.

Each row may have ASSEMBLY_ID1, or ASSEMBLY_ID2, or both the columns populated. If ASSEMBLY_ID1 alone is populated it means that component is unique to the first bill in the comparison. If ASSEMBLY_ID2 alone is populated it means that component is unique to the second bill in the comparison. If ASSEMBLY_ID1 and ASSEMBLY_ID2 are both populated, it means that component is common to the two bills being compared.

SEQUENCE_ID is the unique key to this table for a given execution of an inquiry or report. It contains the next available sequence number from the sequence BOM_COMPARISON_TEMP_S.

BOM_DELETE_ENTITIES

BOM_DELETE_ENTITIES stores information about items, bills, or routings you choose to delete in your delete group.

Oracle Bills of Material stores the item number and description of the item you delete in ITEM_CONCAT_SEGMENTS and ITEM_DESCRIPTION. These values are stored to report and query on if you delete the item.

PRIOR_PROCESS_FLAG stores whether the row originates from the user or is automatically created by Oracle Bills of Material. If a user entered the row, the Delete Item User-exit process does not affect the row.

BOM_DELETE_SQL_STATEMENTS

This table stores information about delete statements and constraints. Oracle Bills of Material provides you with a pre-defined set of constraints to maintain data integrity. You should not delete these constraints. You can add your own constraints using the Define Delete Constraints (BOMFDCON) window. Oracle Bills of Material also stores delete sql statements that the Delete program (BMCDEL) uses to purge data from the database.

BOM_DEPARTMENT_RESOURCES

BOM_DEPARTMENT_RESOURCES stores information about resources that you assign to a department. You then use these resources on routing operations. You can define multiple resources for a department.

SHARE_CAPACITY_FLAG determines if the current department shares its capacity with other departments. SHARE_FROM_DEPT_ID indicates the department which shares the capacity shares of a resource with your department.

You can use RESOURCE_GROUP_NAME to group resource assignments to departments. Oracle Capacity uses this information when performing resource rollups.

BOM_DEPENDENT_DESC_ELEMENTS

BOM_DEPENDENT_DESC_ELEMENTS stores information about the descriptive elements assigned to a bill of material. You can only assign descriptive elements to model and option class bills of material. You can choose from those defined in MTL_DESCRIPTIVE_ELEMENTS. For model bills of material, you can only choose descriptive elements that are in the model item’s catalog group.

The descriptive elements assigned to a bill of material are used to assign descriptive element values to configuration items that are created for model/option sales orders.

The bill loop check process uses COMPONENT_CODE to detect loops. COMPONENT_CODE store s the concatention of item ids down any branch in the indented structure tree. The explosion process left pads the ids with 0s up to 16 characters. For example:

```
= Component Component_code -----
-----

A      00000000000000011 B      000000000000011000000000000012 C
      000000000000011000000000000013 D
00000000000000011000000000000012000000000000014 E
00000000000000011000000000000012000000000000015 F
00000000000000011000000000000013000000000000016 G
00000000000000011000000000000013000000000000017

```

The explosion and bill loop check processes set the LOOP_FLAG to 1, if a loop is detected in the assembly.

BOM_IMPLOSION_TEMP

BOM_IMPLOSION_TEMP stores temporary information about where an item is used in a bill of material structure. The item implosion process generates this information by recursively travelling up the bill of material structure. This table is used by the Item Where Used Report.

SEQUENCE_ID is the unique identifier for each implosion process.

LOWEST_ITEM_ID is the item that you are imploding.

CURRENT_ITEM_ID is the item id of the current row.

PARENT_ITEM_ID is the item id of the parent of the current item.

LOWEST_ALTERNATE_DESIGNATOR is the alternate of each first level parent of the imploded item.

`SORT_CODE` stores information about a particular node in the indented structure. You must order the rows by `SORT_ORDER` to retrieve the correct bill structure. The following example shows how the sort order is determined (`inventory_item_ids` are in parentheses).

An implosion of item F will generate the following sort orders:

| Item | Sort Order |
|------|--------------|
| F | 001 |
| D | 001001 |
| C | 001002 |
| B | 001001001 |
| A | 001002001 |
| A | 001001001001 |

When you select and order by `SORT_ORDER`, you get:

F
.D
..B
...A
.C
...A

BOM_INTERFACE_DELETE_GROUPS

BOM_INTERFACE_DELETE_GROUPS contains the default delete group names for bills, components, routings, and operations. These names are used when the Bill, Routing, and ECO Open Interfaces are instructed to delete these type of objects.

Column Descriptions

BOM_INVENTORY_COMPONENTS

BOM_INVENTORY_COMPONENTS stores information about bills of material components. This table only stores single-level components. COMPONENT_SEQUENCE_ID uniquely identifies each row. There is one row per component on an operation within a given date range.

This table is the main child table of BOM_BILL_OF_MATERIALS and references the parent using BILL_SEQUENCE_ID. It uses EFFECTIVITY_DATE and DISABLE_DATE to time phase components into a bill of material. The Bill of Material window enforces that only one row for a component in an operation is effective at a given time.

REVISED_ITEM_SEQUENCE_ID points to the revised item on an ECO that affects a particular component row. If IMPLEMENTATION_DATE is null, the component is pending on an engineering change that has not yet been implemented. IMPLEMENTATION_DATE is either NULL (pending on ECO) or equals EFFECTIVITY_DATE (implemented). OLD_COMPONENT_SEQUENCE_ID points to the original component row affected by this component row through an engineering change.

This table also contains certain columns relating to shipping, billing and accounting for revenue on a customer order through Oracle Order Management. CHECK_ATP determines if an ATP check is required for this item when placing an order and overrides the Item level ATP flag. LOW_QUANTITY and HIGH_QUANTITY define minimum and maximum quantities of this component item that can be placed on an order if the customer chooses to override COMPONENT_QUANTITY. OPTIONAL decides if a component is a required option class you have to choose from (for Option Class items) or a required item (for Standard items) when taking an order. For Option Class items, MUTUALLY_EXCLUSIVE_OPTIONS decides if one or more of its components can be placed on an order when you pick this option class.

OPERATION_LEAD_TIME_PERCENT is denormalized for performance from BOM_OPERATION_SEQUENCES when rolling up cumulative leadtimes.

The ORGANIZATION_ID for the component can be derived from the BOM_BILL_OF_MATERIALS table using BILL_SEQUENCE_ID.

Database Triggers

Trigger Name : BOMTBICK
 Trigger Time : AFTER
 Trigger Level : ROW
 Trigger Event : INSERT, UPDATE, DELETE

This trigger marks the preexploded data in BOM_EXPLOSIONS for re-explosion. It sets the REXPLODE_FLAG = 1 for the records that reference the bill in which the component record is being changed.

BOM_INVENTORY_COMPS_ARCHIVE

Used by Delete Group program to archive deleted components.

Sequences

| Sequence | Derived Column |
|----------------------------|-----------------------|
| BOM_INVENTORY_COMPONENTS_S | COMPONENT_SEQUENCE_ID |

BOM_INVENTORY_COMPS_INTERFACE

BOM_INVENTORY_COMPS_INTERFACE temporarily stores information about bill of material components. This table is shared by the Bills of Material and Engineering Change Order open interfaces.

This table contains user friendly columns which allow you to easily enter your data as well as their corresponding foreign keys. The open interfaces will derive column values you do not enter, after performing the proper validation. For example, you enter the ORGANIZATION_CODE and the open interfaces will fill in the corresponding ORGANIZATION_ID for you.

Also, you can enter ASSEMBLY_ITEM_ID, ORGANIZATION_ID and ALTERNATE_BOM_DESIGNATOR instead of BILL_SEQUENCE_ID. The open interfaces will fill in the corresponding BILL_SEQUENCE_ID.

In addition, you can enter BILL_SEQUENCE_ID, COMPONENT_ITEM_ID, OPERATION_SEQ_NUM, and EFFECTIVITY_DATE instead of COMPONENT_SEQUENCE_ID. The open interfaces will fill in the corresponding COMPONENT_SEQUENCE_ID.

You can enter one reference designator and one substitute component for each component you enter. Oracle Bills of Material will insert these records into the tables, BOM_REFERENCE_DESIGNATORS and BOM_SUBSTITUTE_COMPONENTS, respectively.

BOM_LOW_LEVEL_CODES

BOM_LOW_LEVEL_CODES stores temporary data for cumulative rollup of lead times. It also stores the exploded BOM structure for an assembly. The value of LOW_LEVEL_CODE for an item (INVENTORY_ITEM_ID) determines which level it is in the BOM structure. The cumulative lead time (CUMULATIVE_TOTAL_LEAD_TIME), and cumulative manufacturing lead time (CUM_MANUFACTURING_LEAD_TIME) are calculated for all make-items at each BOM level.

BOM_OPERATIONAL_ROUTINGS

BOM_OPERATIONAL_ROUTINGS stores information about manufacturing and engineering routings.

If a routing shares its operation steps with another routing in the same organization, COMMON_ROUTING_SEQUENCE_ID is a reference to that common routing. This is a mandatory column that equals ROUTING_SEQUENCE_ID if there is no common reference. If the routing references a common routing, Oracle Bills of Materials populates the INVENTORY_ITEM_ID of the common into COMMON_ASSEMBLY_ITEM_ID.

BOM_OPERATION_NETWORKS

BOM_OPERATION_NETWORKS stores information about routing networks. The routing network is defined for processes or line operations. Each row in this table represents the connection between two processes or line operations. The column TRANSITION_TYPE stores the type of connection between two processes or line operations. The connection type can be Primary, Alternate, or Rework. The column PLANNING_PCT stores the planning percent for a connection.

This table is populated by the Flow Routings window.

BOM_OPERATION_RESOURCES

BOM_OPERATION_RESOURCES stores information about resources that you require to complete operations on routings. You may assign multiple resources or assign the same resource multiple times at any operation.

The manufacturing lead time process calculates RESOURCE_OFFSET_PERCENT. You may override the value in the Define Routing window. CRP will use this value to calculate resource availability. If you re-run the manufacturing lead time process, it will recalculate and update RESOURCE_OFFSET_PERCENT for scheduling.

BOM_OPERATION_RESOURCES_EFC

BOM_OPERATION_RESOURCES_EFC is used exclusively as an archive table for the "Euro as a functional currency" project. It mirrors the table BOM_OPERATION_RESOURCES prior to conversion to the euro currency.

BOM_OPERATION_SEQUENCES

BOM_OPERATION_SEQUENCES stores information about routing operations. You may define multiple operations for a routing. You must specify the department in which every operation will occur.

Oracle Bills of Material stores the STANDARD_OPERATION_ID if you use a standard operation to define your operation.

You cannot have overlapping effective dates for the same operation. The Define Routing window will prevent you from doing that. For example, you cannot define operations as follows:

| Op Seq | Effective Date | Disable Date |
|-----------|-------------------|-----------------|
| --- | ----- | ----- |
| 10 | 10-SEP-93 | 10-DEC-93 |
| 10 | 20-OCT-93 | |

BOM_OP_RESOURCES_INTERFACE

BOM_OP_RESOURCES_INTERFACE temporarily stores information about resources that you require to complete operations on routings. This table contains user friendly columns which allow you to easily enter your data as well as their corresponding foreign keys. Oracle Bills of Material will derive column values you do not enter, after performing the proper validation. For example, you enter the ORGANIZATION_CODE and Oracle Bills of Material will fill in the corresponding ORGANIZATION_ID for you.

Also, you can enter ROUTING_SEQUENCE_ID, OPERATION_SEQ_NUM, and EFFECTIVITY_DATE instead of OPERATION_SEQUENCE_ID. Oracle Bills of Material will fill in the corresponding OPERATION_SEQUENCE_ID.

In addition, you can enter ASSEMBLY_ITEM_ID, ORGANIZATION_ID and ALTERNATE_ROUTING_DESIGNATOR instead of ROUTING_SEQUENCE_ID. Oracle Bills of Material will fill in the corresponding ROUTING_SEQUENCE_ID.

BOM_OP_RESOURCES_VIEW

The BOM_OP_RESOURCES_VIEW contains information about resources used on routings.

BOM_OP_RESOURCES_VIEW resolves the foreign key information of BOM_OPERATION_RESOURCES from MFG_LOOKUPS, MTL_ITEM_FLEXFIELDS, BOM_OPERATION_SEQUENCES, CST_ACTIVITIES, BOM_OPERATIONAL_ROUTINGS, BOM_DEPARTMENTS, and BOM_RESOURCES.

BOM_OP_SEQUENCES_INTERFACE

BOM_OP_SEQUENCES_INTERFACE temporarily stores information about routing operations. This table contains user friendly columns which allow you to easily enter your data as well as their corresponding foreign keys. Oracle Bills of Material will derive column values you do not enter, after performing the proper validation. For example, you enter the ORGANIZATION_CODE and Oracle Bills of Material will fill in the corresponding ORGANIZATION_ID for you.

Also, you can enter ASSEMBLY_ITEM_ID, ORGANIZATION_ID and ALTERNATE_ROUTING_DESIGNATOR instead of ROUTING_SEQUENCE_ID. Oracle Bills of Material will fill in the corresponding ROUTING_SEQUENCE_ID.

In addition, you can enter three resources and three instructions for each operation sequence. Oracle Bills of Material will insert these records into the tables, BOM_OPERATION_RESOURCES and BOM_OPERATION_INSTRUCTIONS, respectively.

BOM_ORG_CAL_DATES_VIEW

This view allows you to retrieve data from BOM_CALENDAR_DATES without knowing the exception set or calendar name for an organization. The view joins with MTL_PARAMETERS and determines the calendar and exception set to which the organization points. Further, joining to BOM_CALENDAR_DATES gets the calendar dates, sequence number, prior sequence num , prior date, next sequence number, and next date.

```
View Definition
CREATE VIEW BOM_ORG_CAL_DATES_VIEW
as SELECT

BOM_ORG_CAL_PERIODS_VIEW

You can view period information from this view without knowing the calendar name and the exception set for an organization. This view joins with MTL_PARAMETERS to find which calendar and exception set an organization is pointing to. Further, joining to BOM_PERIOD_START_DATES gets all the information on the period start dates, sequence number, period name, next date and prior date.

View Definition

```
CREATE VIEW BOM_ORG_CAL_PERIODS_VIEW

BOM_ORG_CAL_WEEKS_VIEW

This view lets you see data from BOM_CAL_WEEK_START_DATES without knowing the calendar and the exception set for any given organization. This view joins with MTL_PARAMETERS and finds the calendar name and exception set an organization is pointing to. Further, joining to BOM_CAL_WEEK_START_DATES gives the week start date, sequence number, next date, and prior date.

View Definition

```
CREATE VIEW BOM_ORG_CAL_WEEKS_VIEW

BOM_ORG_SHIFT_DATES_VIEW

BOM_ORG_SHIFT_DATES_VIEW allows you to retrieve data from BOM_SHIFT_DATES without knowing the exception set or calendar name for an organization and shift number. This view joins with MTL_PARAMETERS and determines the calendar and exception set to which the organization points. Further, joining to BOM_CALENDAR_DATES gets the calendar dates, sequence number, prior sequence num, prior date, next sequence number, and next date. This view is used in Calendar Define window to show the shift dates for a compiled calendar.

BOM_PERIOD_START_DATES

BOM_PERIOD_START_DATES stores periods between the calendar start date and end dates that the workday calendar program generates. The workday calendar program generates period start dates that depend on the quarterly calendar type you choose for your calendar. For a quarterly calendar type 4–4–5, the first period is the beginning of the first week, second and third period is the end of 4 weeks, fourth is at the end of 5 weeks and so on. Similarly, you can have a 5–4–4 pattern for your calendar. A thirteen period quarterly calendar type has 13 equal periods of 4 weeks each for a year. A regular calendar quarterly calendar type follows a Julian calendar to decide the periods.

Each period start date has a name which can be either 1–13P or JAN–DEC depending on the quarterly calendar type you chose. This table stores next period and prior period. A sequence starting at 1, is assigned to each period.

BOM_REFERENCE_DESIGNATORS

BOM_REFERENCE_DESIGNATORS stores information about bill of material component reference designators. It is a child table of BOM_INVENTORY_COMPONENTS, and stores reference designators for current components as well as components that are pending on ECOs. Even though the column COMPONENT_REFERENCE_DESIGNATOR has the database length of 15 characters, Oracle Bills of Material and Oracle Engineering only allow you to enter reference designators with a maximum length of 10 characters.

BOM_REF_DESGS_INTERFACE

BOM_REF_DESGS_INTERFACE temporarily stores information about bill of material component reference designators. This table is shared by the Bills of Material and Engineering Change Order open interfaces.

This table contains user friendly columns which allow you to easily enter your data as well as their corresponding foreign keys. The open interfaces will derive column values you do not enter, after performing the proper validation. For example, you enter the ORGANIZATION_CODE, and the open interfaces will fill in the corresponding ORGANIZATION_ID for you.

Also, you can enter ASSEMBLY_ITEM_ID, ORGANIZATION_ID and ALTERNATE_BOM_DESIGNATOR instead of BILL_SEQUENCE_ID. The open interfaces will fill in the corresponding BILL_SEQUENCE_ID.

In addition, you can enter BILL_SEQUENCE_ID, COMPONENT_ITEM_ID, OPERATION_SEQ_NUM, and EFFECTIVITY_DATE instead of _COMPONENT_SEQUENCE_ID. The open interfaces will fill in the corresponding COMPONENT_SEQUENCE_ID.

BOM_RESOURCES

BOM_RESOURCES stores information about resources, overheads, material overheads, and material sub-elements. COST_ELEMENT_ID determines the type of the resource. Resources are additionally classified as either material resources or outside processing resources

If the resource represents a currency unit, UNIT_OF_MEASURE stores the currency code associated with the set of books the organization points to.

BOM_SHIFT_DATES

BOM_SHIFT_DATES stores information about compiled data for shift calendars. This table stores every date between the calendar start date and calendar end date for a calendar name and exception set. The workday calendar program assigns a sequence number starting at 1, to each date. The program generates the prior sequence number and next sequence number for every calendar date that is stored in this table. This table stores values for sequence number, prior sequence number and next sequence number for a non-working day. The values for these columns are equal to a working day. The workday calendar program generates a shift calendar for each shift you define for your calendar.

BOM_SHIFT_EXCEPTIONS

BOM_SHIFT_EXCEPTIONS stores information about exception dates for a calendar name, exception set, and shift. You can define these exception dates to be either working or non-working (EXCEPTION_TYPE 1 for On and 2 for Off). The workday calendar program generates all dates between calendar start date and calendar end date. It then marks the workday pattern on generated dates followed by the base calendar exception dates. Finally, it marks the shift exception dates. This table stores exception dates for the shift calendars, the table BOM_CALENDAR_EXCEPTIONS stores exception dates for the base calendar.

BOM_SMALL_EXPL_TEMP

BOM_SMALL_EXPL_TEMP stores temporary, indented bill of material structures for online processes (Indented Inquiry). The explosion process (BOMPEXPL) populates this table when exploding a single or a range of bills of material.

GROUP_ID identifies all rows generated from an explosion.

TOP_BILL_SEQUENCE_ID is the bill sequence id of the exploded bill.

The explosion process constructs SORT_ORDER that correctly determines the node of the row in the bill structure. You must order the rows by SORT_ORDER to retrieve the correct bill structure. The following information shows an example of how the sort order is determined (inventory_item_ids are in parentheses).

| Component | Sort_order |
|-----------|------------|
| ----- | ----- |
| A | 001 |
| B | 001001 |
| C | 001002 |
| D | 001001001 |
| E | 001001002 |
| F | 001002001 |
| G | 001002002 |

When you select and order by SORT_ORDER, you get:

```
A
.B
..D
..E
.C
..F
..G
```

The bill loop check process uses COMPONENT_CODE to detect loops. COMPONENT_CODE stores the concatenation of item ids down any

branch in the indented structure tree. The explosion process left pads the ids with 0s up to 16 characters. For example:

| Component | Component_code |
|-----------|--|
| ----- | ----- |
| A | 0000000000000011 |
| B | 000000000000001100000000000012 |
| C | 000000000000001100000000000013 |
| D | 0000000000000011000000000000120000000000014 |
| E | 00000000000000110000000000001200000000000015 |
| F | 00000000000000110000000000001300000000000016 |
| G | 00000000000000110000000000001300000000000017 |

The explosion and bill loop check processes set the LOOP_FLAG to 1, if a loop is detected in the assembly.

BOM_SMALL_IMPL_TEMP

BOM_SMALL_IMPL_TEMP stores temporary information about where an item is used in a bill of material structure. The item implosion process generates this information by recursively travelling up the bill of material structure. This table is used by the View Item Usage window.

SEQUENCE_ID is the unique identifier for each implosion process.

LOWEST_ITEM_ID is the item that you are imploding.

CURRENT_ITEM_ID is the item id of the current row.

PARENT_ITEM_ID is the item id of the parent of the current item.

LOWEST_ALTERNATE_DESIGNATOR is the alternate of each first level parent of the imploded item.

`SORT_CODE` stores information about a particular node in the indented structure. You must order the rows by `SORT_ORDER` to retrieve the correct bill structure. The following example shows how the sort order is determined (`inventory_item_ids` are in parentheses).

An implosion of item F will generate the following sort orders:

| Item | Sort Order |
|------|--------------|
| F | 001 |
| D | 001001 |
| C | 001002 |
| B | 001001001 |
| A | 001002001 |
| A | 001001001001 |

When you select and order by `SORT_ORDER`, you get:

F
.D
..B
...A
.C
...A

BOM_STANDARD_OPERATIONS

BOM_STANDARD_OPERATIONS stores information about the standard operations, events, processes, and line operations that you define. Events/processes/line operations are for Flow Manufacturing.

You can use these standard operations/events/processes/line operations when you define routing steps to build your assembly. The Define Routing window defaults all data for the standard operation/events/processes/line operation into the routing step.

BOM_OPERATION_SEQUENCES and BOM_STANDARD_OPERATIONS share the descriptive flex definition. Therefore, the Define Routing window will also copy the descriptive flex information into the routing step.

BOM_STD_OP_RESOURCES

BOM_STD_OP_RESOURCES stores information about resources you assign to standard operations. You may assign multiple resources to your standard operations.

When you use a standard operation to define your routing step, the Define Routing window copies the standard operation resources as operation resources. Since BOM_STD_OP_RESOURCES shares descriptive flex definition with BOM_OPERATION_RESOURCES, the window will also copy the descriptive flex information.

Database Triggers

Trigger Name : BOM_STD_OP_RESOURCES_T1
 Trigger Time : BEFORE
 Trigger Level : ROW
 Trigger Event : INSERT

When you create a standard resource for a standard operation, then this trigger creates a corresponding row in the BOM_OPERATION_RESOURCES table for every routing operation that references this standard operation.

Trigger Name : BOM_STD_OP_RESOURCES_T2
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : UPDATE

When you update a standard resource for a standard operation, then this trigger updates every corresponding row in the BOM_OPERATION_RESOURCES table for all the routing operations that reference this standard operation.

Trigger Name : BOM_STD_OP_RESOURCES_T3
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : DELETE

When you delete a standard resource for a standard operation, then this trigger deletes every corresponding row in the BOM_OPERATION_RESOURCES table for all the routing operations that reference this standard operation.

BOM_SUBSTITUTE_COMPONENTS

BOM_SUBSTITUTE_COMPONENTS stores information about the substitute components associated with a bill of material component. It is a child table of BOM_INVENTORY_COMPONENTS, and stores substitute components of current components as well as components that are pending on ECOs. Substitute components appear on MRP reports.

The column SUBSTITUTE_ITEM_QUANTITY stores the quantity of substitute items needed to replace the full component quantity as represented in the COMPONENT_QUANTITY column of the BOM_INVENTORY_COMPONENTS table.

BOM_SUB_COMPS_INTERFACE

BOM_SUB_COMPS_INTERFACE temporarily stores information about the substitute components associated with a bill of material component. This table is shared by the Bills of Material and Engineering Change Order open interfaces.

This table contains user friendly columns which allow you to easily enter your data as well as their corresponding foreign keys. The open interfaces will derive column values you do not enter, after performing the proper validation. For example, you enter the ORGANIZATION_CODE, and the open interfaces will fill in the corresponding ORGANIZATION_ID for you.

Also, you can enter ASSEMBLY_ITEM_ID, ORGANIZATION_ID and ALTERNATE_BOM_DESIGNATOR instead of BILL_SEQUENCE_ID. The open interfaces will fill in the corresponding BILL_SEQUENCE_ID.

In addition, you can enter BILL_SEQUENCE_ID, COMPONENT_ITEM_ID, OPERATION_SEQ_NUM, and EFFECTIVITY_DATE instead of COMPONENT_SEQUENCE_ID. The open interfaces will fill in the corresponding COMPONENT_SEQUENCE_ID.

BOM_WORKDAY_PATTERNS

BOM_WORKDAY_PATTERNS stores the days on/days off patterns for your calendar and your shifts. You can define multiple days on/days off to form a repetitive pattern. The calendar compile program (BMCPCL) will create a workday calendar based on this repeating pattern along with the exceptions that you may define. SEQ_NUM is the order of your days on/days off to create the repeating workday pattern. For example, if you define a calendar as follows:

= SeqNum DaysOn DaysOff 1 5 2 2 4 3 =

Your repeating workday pattern will be over 14 days (5+2+4+3) as follows: = 5 days on 2 days off 4 days on 3 days off =

CRP_RESOURCE_HOURS

CRP_RESOURCE_HOURS stores a row for each resource or repetitive line required to build an assembly from its lowest level components. Each row also includes the department where the assembly is being built, the resource hours required, the usage of the components in the assembly, and the set back days from the due date of the assembly when the resource or the line is required.

RESOURCE_DEPARTMENT_HOURS is calculated by multiplying the usage rate or amount of the assembly by the conversion rate defined for that assembly.

SETBACK_DAYS is the number of days from the due date of the assembly that the resource is needed.

ASSEMBLY_USAGE is a resource hours multiplier derived from the usage of the component. Therefore the assembly usage for the resource required to make an assembly from its immediate components is one.

SOURCE_ITEM_ID is the component in the assembly that is the source of the repetitive or routing-based requirements.

This table is populated by the Bill of Resource Load concurrent program and the Enter Bill of Resources form. The rough cut capacity inquiry and report use this table to compile the rough cut capacity plan.

CRP_SIMULATION_SETS

CRP_SIMULATION_SETS stores the names of the simulation sets. Simulation sets are used to group multiple resource changes. Each resource change defined in BOM_RESOURCE_CHANGES can be associated with a simulation set. The USE_IN_WIP flag determines if the resource change associated with a particular simulation set is used by the WIP scheduler. The RCCP and CRP reports and inquiries can be run for a particular simulation set.

CST_COMP_SNAPSHOT

CST_COMP_SNAPSHOT contains snapshot information from WIP_OPERATIONS. When the user performs a WIP assembly completion, assembly return, or scrap transaction, operation information such as assembly units completed at each operation step and other details from WIP_OPERATIONS are inserted into this table.

In an average costing organization, when the user completes assemblies and chooses the "Use Actual Resources" system option, the information in CST_COMP_SNAPSHOT is used by the Actual Cost Worker (CMCACW) to calculate the cost of WIP assembly completion, assembly return, and scrap transactions.

CST_COST_GROUPS

Stores cost group definitions. Cost groups are used in average costing and project manufacturing. A cost group can be associated with a specific average costing organization or can be a multiple organization cost group. A cost group that is associated with a project that spans multiple inventory organizations must be a multiple organization cost group. A multiple organization 'common' cost group is seeded in the table. Multiple projects can share a cost group. In addition, cost groups can also be used as organization cost groups for periodic costing. Identified by cost group type, the organization cost group is used for periodic costing to calculate costs for a collection of one or more inventory organizations within a legal entity.

CST_COST_TYPES

CST_COST_TYPES stores cost type definitions. The table is seeded with three cost types: Frozen, Average, and Pending. The Frozen cost type is used in standard costing organizations. The average cost type is used in average costing organizations. All costs reference a cost type.

PL_ELEMENT_FLAG, PL_RESOURCE_FLAG, PL_OPERATION_FLAG, PL_ACTIVITY_FLAG values are used by the Cost Rollup to determine whether to group rollup costs by cost element, sub element, operation sequence number, or activity.

BOM_SNAPSHOT_FLAG is used by the Cost Rollup to determine whether to save the bill structure when rolling up costs for a cost type.

CST_EXPLOSION_TEMP

CST_EXPLOSION_TEMP stores temporary, indented bill of material structures and is populated during the Cost Rollup process.

GROUP_ID identifies all rows generated by an explosion. DELETED and LOOP_COUNT are used by the exploder during the explosion process to compute low level codes.

CST_EXPLOSION_TEMP is used only for full Cost Rollups, for all items, and when no report is requested in the Cost Rollup.

CST_INQUIRY_TEMP

CST_INQUIRY_TEMP stores item cost information used by the View Item Cost Information window for each inquiry session. The window has two templates (summary and summary by level) to display item costs.

CST_INQUIRY_TYPES

CST_INQUIRY_TYPES stores item cost inquiry option information. This information is used by the View Item Costs Summary window.

The INQUIRY_NAME column stores the option name. The UNIQUE_ID column stores the unique identifier for INQUIRY_NAME. For example, UNIQUE_ID '13' corresponds to the inquiry 'Element by level.' You can create user-defined inquiries by entering 1 in the USER_DEFINED column. The UNIQUE_ID for user-defined inquiries is determined by the sequence CST_INQUIRY_TYPES_S.

Each inquiry is associated with a template type (GUI_TEMPLATE_TYPE). The template type determines which columns are displayed in the View Item Costs Summary window. For example, when an inquiry that is associated with the template type 'Single entity cost summary' is selected, two columns are displayed. However, when an inquiry that is associated with the template type 'Two entity cost summary' is selected, three columns are displayed.

The actual column headings displayed in the View Item Costs Summary window are determined by the exact inquiry selected. For example, although both the 'Activity Summary' and 'Element Summary' inquiries are associated with the two column 'Single entity cost summary' template type, the column headings Activity and Description (corresponding to GUI_COL2_PROMPT_BOTTOM and GUI_DESC_PROMPT) are displayed when the former is chosen, while the column headings Cost, Element, and Description (corresponding to GUI_COL2_PROMPT_TOP, GUI_COL2_PROMPT_BOTTOM and GUI_DESC_PROMPT) are displayed when the latter is chosen.

The VIEW_NAME column stores the view name that is used when the View Item Cost Summary window copies queried cost information to the CST_INQUIRY_TEMP table. Different views are used for different inquiries. For example, if you choose 'Activity summary,' the VIEW_NAME is 'CST_ELEMENT_COST_VIEW.'

FLEXFIELD_APPLICATION_ID and DESCRIPTIVE_FLEXFIELD_NAME store the application identifier and descriptive flexfield name for those inquiry options that display costs by flexfield segment value and require the user to choose a flexfield segment. They are used to retrieve segments for the flexfield.

INVENTORY_FLAG specifies whether this option is available in a standalone inventory installation. Some of the detail options are not

needed for standalone inventory installations, such as Element by operation.

CST_ITEM_COSTS

CST_ITEM_COSTS stores item cost control information by cost type.

For standard costing organizations, the item cost control information for the Frozen cost type is created when you enter a new item. For average cost organizations, item cost control information is created when you transact the item for the first time.

You can use the Item Costs window to enter cost control information.

CST_ITEM_COST_DETAILS

CST_ITEM_COST_DETAILS stores detailed cost information for an item for a cost type. It is the child table of CST_ITEM_COSTS.

There are three types of detailed item cost: User-defined, Defaulted, and Rolled up. User-defined costs can be entered in the Item Costs window. Defaulted and Rolled up costs are generated by Cost Rollup.

If the item does not have cost control information for the cost type you are rolling up, Cost Rollup copies this level detailed cost information from the default cost type and marks the rows as Defaulted. Previous level costs are rolled up costs.

CST_LOW_LEVEL_CODES

CST_LOW_LEVEL_CODES is a temporary table. The low level codes for the items are inserted into this table during a Cost Rollup.

Notes:

- BOMPEXPL populates CST_LOW_LEVEL_CODES
- CSTPUCRU obtains the low level codes for the items being rolled up

CST_MGD_INFL_ADJ_PER_STATUSES

CST_MGD_INFL_ADJ_PER_STATUSES is an extension of the ORG ACCOUNTING PERIOD entity. It is used to store the status of a period with respect to the Inflation Adjustment process. A row is inserted in this table when the transfer to General Ledger is completed for a given period, indicating that the period has been finalized.

CST_MGD_INFL_TSF_ORG_ENTRIES

CST_MGD_INFL_TSF_ORG_ENTRIES is used to store the opposing organization's journal entry information for transfers. Once accounting is generated for a period and the transfer to General Ledger is completed, the data is deleted from this table. Journal entry value is stored in ENTERED_DR (debit) or ENTERED_CR (credit), but not both values in one row.

CST_REPORT_TYPES

CST_REPORT_TYPES stores detail options and all relevant Item Cost Reports information by cost type. A detail option specifies how to summarize item costs and which template to use to display the item costs.

REPORT_NAME stores the report name option, for example, 'Element by Level.' UNIQUE_ID is the unique identifier for REPORT_NAME and is obtained from sequence CST_REPORT_TYPES_S. USER_DEFINED indicates whether this is a user-defined option or predefined option. For customized options, enter 1 for the USER_DEFINED field.

There are two different report layouts. COLUMN1_HEADING and COLUMN2_HEADING stores the first and second column headings for both layouts.

COLUMN1_HEADING and COLUMN2_HEADING hold the source of the cost information for the report option. For example, for the Element by Sub-Element report COLUMN1_HEADING uses COST_ELEMENT and COLUMN2_HEADING uses RESOURCE.

FLEXFIELD_APPLICATION_ID and DESCRIPTIVE_FLEXFIELD_NAME store the application identifier and descriptive flexfield name for reports that require flexfield segment values and are used to retrieve segments for the flexfield.

INVENTORY_FLAG specifies whether this report is available for a standalone inventory installation. Some of the detail options are not available for standalone inventory installations, such as Element by operation.

CST_RESOURCE_OVERHEADS

CST_RESOURCE_OVERHEADS stores information about resource overheads. When the Cost Manager invokes the proper cost worker, based on whether the organization is using average or standard costing, the information in this table is used to determine the resource overhead that should be applied. To earn overhead based on resources, the overhead must be associated with the resource being transacted and a rate must be defined for the resource for the department in which the resource is transacted.

MTL_LOT_NUMBERS

MTL_LOT_NUMBERS stores the definition and expiration date of all lot numbers in inventory.

Since the primary key consists of LOT_NUMBER, ORGANIZATION_ID, and INVENTORY_ITEM_ID, a lot number could exist in more than one organization or for different items.

MTL_MANUFACTURERS

MTL_MANUFACTURERS stores the definition of a manufacturer of items defined in Oracle Inventory. This information may be used to search for items by manufacturer or by manufacturer's part number.

Manufacturer part numbers for items produced by the manufacturers defined here are stored in MTL_MFG_PART_NUMBERS.

MTL_MATERIAL_STATUSES

MTL_MATERIAL_STATUSES is the definition table for the inventory statuses. The defined status can be assigned to Subinventory, locator, lot and serial to restrict certain transaction types. This table is only used to seed the predefined statuses. MTL_MATERIAL_STATUSES_B and MTL_MATERIAL_STATUSES_TL are used in the applications.

MTL_MATERIAL_TRANSACTIONS

MTL_MATERIAL_TRANSACTIONS stores a record of every material transaction or cost update performed in Inventory.

Records are inserted into this table either through the transaction processor or by the standard cost update program. The columns TRANSACTION_TYPE_ID, TRANSACTION_ACTION_ID, TRANSACTION_SOURCE_TYPE_ID, TRANSACTION_SOURCE_ID and TRANSACTION_SOURCE_NAME describe what the transaction is and against what entity it was performed.

All accounting journal entries for a given transaction are stored in MTL_TRANSACTION_ACCOUNTS, joined by the column TRANSACTION_ID.

If the item is under lot control then the lot records are stored in MTL_TRANSACTION_LOT_NUMBERS, joined by the column TRANSACTION_ID. If the item is under serial control then the serial records are stored in MTL_UNIT_TRANSACTIONS, joined by the column TRANSACTION_ID. The Item revision and locator control are stored in the columns REVISION and LOCATOR_ID respectively.

Transfer transactions are represented as two single records in the table. They are related through the column TRANSFER_TRANSACTION_ID, which contains the TRANSACTION_ID of the other transaction in the transfer.

The index MTL_MATERIAL_TRANSACTIONS_UPGD is used only during install and upgrade, and will be dropped during the course thereof, but is included here for completeness.

Database Triggers

Trigger Name : JA_AU_LOCAL_ACCOUNTING
 Trigger Time : AFTER
 Trigger Level : ROW
 Trigger Event : UPDATE

This trigger is on the COSTED_FLAG column of MTL_MATERIAL_TRANSACTIONS. It calls a PL/SQL package to update MTL_TRANSCATION_ACCOUNTS.REFERENCE_ACCOUNT with the value in MTL_MATERIAL_TRANSACTIONS.DISTRIBUTION_ACCOUNT_ID. This trigger is installed and active only if you have installed Asia/Pacific Localizations (JA).

Trigger Name : AX_MTL_MAT_TRANS_AR11
 Trigger Time : AFTER
 Trigger Level : ROW
 Trigger Event : INSERT

This trigger captures information needed to create subledger accounting events when Oracle Inventory and the set of books used is defined as a subledger in the Global Accounting Engine application. This trigger captures accounting events related to Oracle Inventory cost updates. It fires right after the cost update program create a cost update for an inventory transaction. This trigger populates the AX_EVENTS table.

Trigger Name : AX_MTL_MAT_TRANS_BRU1
 Trigger Time : BEFORE
 Trigger Level : ROW
 Trigger Event : UPDATE

This trigger captures information needed to create subledger accounting events when Oracle Inventory and the set of books used is defined as a subledger in the Global Accounting Engine application. This trigger captures accounting events related to Oracle Inventory material transactions. It executes when the inventory transaction is processed by the cost processor. This trigger populates the AX_EVENTS table.

MTL_MATERIAL_TRANSACTIONS_EFC

MTL_MATERIAL_TRANSACTIONS_EFC is used exclusively as an archive table for the "Euro as a functional currency" project. It mirrors the table MTL_MATERIAL_TRANSACTIONS prior to conversion to the euro currency.

Column Descriptions

| SET_OF_BOOKS_ID | NULL | NUMBER | Set Of Books Identifier |

MTL_MATERIAL_TRANSACTIONS_TEMP

MTL_MATERIAL_TRANSACTIONS_TEMP is the gateway for all material transactions.

Records are processed from this table into Inventory through the transaction processor. All Inventory transaction forms write directly to this table. Outside applications must write transaction records to MTL_TRANSACTIONS_INTERFACE to be processed through MTL_MATERIAL_TRANSACTIONS_TEMP and the transaction processor by the Transaction Worker concurrent program.

Lots and serial numbers for a MTL_MATERIAL_TRANSACTIONS_TEMP(MMTT) record are stored in the tables MTL_TRANSACTION_LOTS_TEMP(MTLT) and MTL_SERIAL_NUMBERS_TEMP(MSNT). If the item is under lot control, then MMTT.TRANSACTION_TEMP_ID joins to MTLT.TRANSACTION_TEMP_ID. If the item is also under serial number control, then MTLT.SERIAL_TRANSACTION_TEMP_ID joins to MSNT.TRANSACTION_TEMP_ID. If the item is only under serial number control, then MMTT.TRANSACTION_TEMP_ID joins to MSNT.TRANSACTION_TEMP_ID.

Transfer transactions are stored in this table as a single record. The transaction processor creates two transactions from the single record.

MTL_MATERIAL_TXN_ALLOCATIONS

MTL_MATERIAL_TXN_ALLOCATIONS stores the repetitive schedules charged by a material transaction. Each row contains the quantity transacted to each schedule for a given transaction. Oracle Work in Process uses this information to report the changes to individual schedules for multi-schedule material transactions.

MTL_MFG_PART_NUMBERS

MTL_MFG_PART_NUMBERS stores the cross reference between an item defined in Oracle Inventory and the part number used by its manufacturer. This information can be used to perform item searches by manufacturer part number.

Manufacturer part number references are defined for an item in the item master organization.

MTL_MGD_INVENTORY_POSITIONS

MTL_MGD_INVENTORY_POSITIONS stores the data sets built for on line display or for export. It should be considered a temporary table since its content is a denormalization of the transactional data built for extraction purposes. This table contains a row for every combination of data set name, bucket name, organization code and inventory item code.

MTL_MOVEMENT_PARAMETERS

This table stores all parameters required for movement statistics gathering and reporting by legal entities. A legal entity is associated with a statistical calendar, a category set for commodity codes, and currency conversion parameters. The table also stores the period name and reference for the latest official 'Frozen' report runs.

MTL_MOVEMENT_STATISTICS

MTL_MOVEMENT_STATISTICS stores all relevant information for movement statistics transactions. Each transaction is identified by a unique MOVEMENT_ID number. The MOVEMENT_TYPE column indicates whether the movement is a dispatch, dispatch adjustment, arrival, or arrival adjustment. Transactions that are generated from external feeder systems have a DOCUMENT_SOURCE_TYPE of 'MISC', and their document and invoice references are not validated. Other movement transactions generated from Oracle Inventory, Oracle Purchasing, Oracle Order Management, or Oracle Shipping Execution are validated against their related document and invoice references via the appropriate foreign key reference columns. PARENT_MOVEMENT_ID ties multiple movements for receiving transaction adjustments. Each movement statistics record is associated with a status that can assume one of the following

- Open – newly created
- Verified – record validated by the exception report
- Frozen – record reported to the government through paper based report

EDI sent – record reported to government through EDI transaction If the record is in Frozen or EDI sent status, the user is not allowed to modified it nor to regenerate a paper based report or the EDI transaction. This implies that, in case the government rejects a reported record, users have to reset the status to open on order to modify the record and regenerate the report. This function is implemented by the Reset Transaction Status report. that for a given legal entity, economic zone, usage type, statistical type and period resets the status to open for all the records. Please note that the four logical states previously listed are implemented in the MTL_MOVEMENT_STATISTICS table by two seperate columns:

MOVEMENT_STATUS

EDI_SENT: having possible values Y, N

MTL_MVT_STATS_RULES

This table stores validation rules defined for movement statistics fields that belong to a rule set as defined in MTL_MVT_STATS_RULE_SETS_B table. Each row stores a rule that can determine a valid set of values for a field or an alternate unit of measure for the weight of a commodity code. Each row is uniquely identified by the combination of a Rule_Set_Code and a Rule_Number. Attribute_Code stores the movement statistics field name for which a rule is defined or the alternate unit of measure code. Attribute_Property_Code, Attribute_Lookup_Type and Source_Type columns qualify an attribute_code that stores the field names. Commodity_Code stores the commodity code associated to a Category Set as defined in the MTL_MVT_STATS_RULE_SETS_B as the category_set_id.

| ATTRIBUTE_CODE | NOT NULL | VARCHAR2(50) | Stores column name of the Movement Statistics field for which a field property rule is defined. Alternately stores alternate unit of measure code defined for a commodity code . |
| ATTRIBUTE_PROPERTY_CODE | NULL | VARCHAR2(30) | Property of field determining whether it is a required and/or updateable. This is only relevant to a Attribute Property rule and is null for Alternate Uom rule. Attribute_Property_Code can have four values namely Required Updateable, Required Non updateable, Not Required Updateable, Not Required Non Updateable. |
| ATTRIBUTE_LOOKUP_TYPE | NULL | VARCHAR2(30) | Lookup Type associated to a field for a valid list of values. Null for alternate uom rule. |

MTL_MVT_STATS_RULE_SETS_B

This table stores validation rule sets defined for parameters of the Movement Statistics records. You need one row to define a rule set in the table. Each row is identified by a Rule_Set_Code. Rule_Set_Type determines the type of rule set. Valid values are, 'Attribute Property' for rule sets associated to fields of movement statistics record. 'Alternate Uom' for rules sets associated with alternate unit of measures defined for a commodity code. Seeded_Flag determines if the rule is seeded or is user defined, valid values are 'Y' for preseeded rules and 'N' for user defined rules.

Column Descriptions

| Name | Null? | Type | Description |
|-------------------|----------|--------------|--|
| RULE_SET_CODE | NOT NULL | VARCHAR2(30) | Unique Identifier of a Rule Set. |
| RULE_SET_TYPE | NOT NULL | VARCHAR2(30) | Type of Rule Set.Rule Set could be of two types, 'Attribute Property' that defines valid values associated to a field in movement statistics record. Or 'Alternate Uom' which gives an alternate unit of measure for a commodity code. |
| SEEDED_FLAG | NOT NULL | VARCHAR2(1) | Flag to state whether Rule Set is system seeded or user defined. Valid values are 'Y' for preseeded rule sets and 'N' for user defined. |
| CATEGORY_SET_ID | NULL | NUMBER | Category Set ID is used for alternate uom rule type to determine valid commodity codes falling under a category set. Each row in MTL_STAT_TYPE_USAGES stores a validation rule set. For alternate unit of measure validation, Category Set ID qualifies the commodity codes that could be associated to a rule in the rules table. |

MTL_MVT_STATS_RULE_SETS_TL

MTL_MVT_STATS_RULE_SET_TL is the corresponding translation table for MTL_MVT_STATS_RULE_SET_B. This table contains one entry for every Rule Set Code and Language. Rule Set Code and Language uniquely identify a row. Rule Set Display Name identifies the Name of a rule set. Rule Set Description gives a description of the rule set. This is the base table of a multilingual entity. MTL_MVT_STATS_RULE_SET_TL contains the language dependent columns.

MTL_ONHAND_QUANTITIES

MTL_ONHAND_QUANTITIES stores quantity on hand information by control level and location.

MTL_ONHAND_QUANTITIES is maintained as a stack of receipt records, which are consumed by issue transactions in FIFO order. The quantity on hand of an item at any particular control level and location can be found by summing TRANSACTION_QUANTITY for all records that match the criteria. Note that any transactions which are committed to the table MTL_MATERIAL_TRANSACTIONS_TEMP are considered to be played out as far as quantity on hand is concerned in Inventory transaction forms. All our Inquiry forms and ABC compile are only based on MTL_ONHAND_QUANTITIES.

MTL_ONHAND_QUANTITIES has two columns, CREATE_TRANSACTION_ID and UPDATE_TRANSACTION_IDs to join to MTL_MATERIAL_TRANSACTIONS.TRANSACTION_ID the transactions that created the row and the transaction that last updated a row.

MTL_ONHAND_QUANTITY_TEMP

MTL_ONHAND_QUANTITY_TEMP is used in the form, Multi-Organization Item Quantities. This form requests Multi-Org Item Quantities report. MTL_ONHAND_QUANTITY_TEMP temporarily stores the item on hand quantity information for the specified organizations. Upon report completion, the stored information is deleted. SEQ_NUM, based on the sequence, MTL_ONHAND_QUANTITY_TEMP_S, is used to distinguish a set of records from others. The C_COLUMNS, D_COLUMNS and N_COLUMNS are generic column names to store character, date and number information respectively.

MTL_PARAMETERS

MTL_PARAMETERS maintains a set of default options like general ledger accounts; locator, lot, and serial controls; inter-organization options; costing method; etc. for each organization defined in Oracle Inventory.

Each organization's item master organization (MASTER_ORGANIZATION_ID) and costing organization (COST_ORGANIZATION_ID) are maintained here.

You specify which manufacturing calendar the organization will use (CALENDAR_CODE), as well as the set of exceptions to this calendar (CALENDAR_EXCEPTION_SET_ID).

NEGATIVE_INV_RECEIPT_CODE indicates whether this organization will allow negative balances in inventory. It is used in the transaction system to ensure, for example, that you do not over-issue a particular item (if you have indicated that negative balances are not allowed).

For lot number and serial number auto-generation, you can specify whether you want the numbers generated from defaults defined at the organization level or the item level (LOT_NUMBER_GENERATION, SERIAL_NUMBER_GENERATION). You can also specify uniqueness constraints for lot numbers (LOT_NUMBER_UNIQUENESS) and serial numbers (SERIAL_NUMBER_TYPE).

Among the accounting defaults that can be defined here are valuation accounts, receiving accounts, profit and loss accounts, and inter-organization transfer accounts.

Database Triggers

Trigger Name : AX_MTL_PARAMETERS_ARDI1
 Trigger Time : AFTER
 Trigger Level : ROW
 Trigger Event : INSERT, DELETE

This trigger captures information needed to create subledger accounting events when Oracle Inventory and the set of books used is defined as a subledger in the Global Accounting Engine application. This trigger ensures that an ?INTRANS? subinventory exists for every inventory organizations. If it does not exist, the subinventory will be created in the table, MTL_SECONDARY_INVENTORY.

MTL_PENDING_ITEM_STATUS

MTL_PENDING_ITEM_STATUS is used to define and store the history of the item statuses that have been or will be assigned to an item.

This table maintains the status history for each item. A row is inserted each time the item status attribute is changed.

This table also stores pending status information. Rows are created for each planned status change that will become effective on a future date.

PENDING_FLAG identifies those status changes that are not yet in effect.

A periodic concurrent program picks up pending status changes on their effective date and updates the specified item and its status controlled attributes accordingly. The row then becomes a history row.

MTL_PER_CLOSE_DTLS

MTL_PER_CLOSE_DTLS stores period end quantities, costs, and values by subinventory, item, and cost group for an organization under Average Costing for Work in Process. The table also stores the period end value in intransit inventory for the organization. This table is populated by the period close program. This table is a child table of MTL_PERIOD_SUMMARY. The table records the inventory value for each inventory item by cost group in the organization at the end of a period.

The COST_GROUP_ID for the intransit inventory will be 1 and SECONDARY_INVENTORY will be NULL.

MTL_PHYSICAL_ADJUSTMENTS

MTL_PHYSICAL_ADJUSTMENTS contains all the information about the adjustment transactions, including the size of the necessary adjustment, the accounts to which the adjustment transaction was posted, and the approval-status of each transaction. An adjustment of zero will still be stored in this table, although it will not cause an adjustment transaction to be posted. This table will always be correct and consistent with any tags that have been entered in MTL_PHYSICAL_INVENTORY_TAGS.

MTL_PHYSICAL_SUBINVENTORIES

MTL_PHYSICAL_SUBINVENTORIES specifies which subinventories are involved in a physical inventory when the physical inventory does not include all subinventories. One row per subinventory per physical inventory.

MTL_PICKING_RULES

MTL_PICKING_RULES stores the pick criteria for each defined rule. The picking criteria consists of the selections of picking preferences regarding an item's revision, lot, subinventory and locator. A picking rule is chosen when performing picking.

MTL_PURGE_HEADER

MTL_PURGE_HEADER maintains a history of transaction purges. Each record includes a purge name, purge date, and the organization.

PURGE_NAME is a name entered by the user when the transaction purge is launched. Transactions that are dated on or before PURGE_DATE will be purged.

The transaction tables that are purged are:

MTL_MATERIAL_TRANSACTIONS
MTL_TRANSACTION_LOT_NUMBERS
MTL_UNIT_TRANSACTIONS
MTL_TRANSACTION_ACCOUNTS
MTL_MATERIAL_TXN_ALLOCATIONS

MTL_RELATED_ITEMS

MTL_RELATED_ITEMS stores the relationships between items. All relationships are defined within the item master organization. Item relationships may be used to search for related and substitute items. Items defined with a substitute relationship to a given item may be received in place of the ordered item when substitutes are allowed.

RELATIONSHIP_TYPE_ID indicates whether the relationship is a 'Substitute' or 'Related' relationship.

RECIPROCAL_FLAG indicates whether the relationship is reciprocal. Defining the relationship as reciprocal has the same effect as defining two separate relationships.

The view, MTL_RELATED_ITEMS_VIEW, explodes the reciprocal relationships and may be used to view all item relationships regardless of how they are defined.

MTL_RELATED_ITEMS_INTERFACE

MTL_RELATED_ITEMS_INTERFACE temporarily stores the relationship between two items before loading this information into Oracle Inventory. This table contains user-friendly columns which allow you to easily enter your data as well as the corresponding foreign keys. Oracle Inventory will default column values you do not enter, after performing the proper validation. For example, if you enter the ITEM_NUMBER, Oracle Inventory will fill in the corresponding INVENTORY_ITEM_ID for you.

This table is not currently used.

MTL_REPLENISH_HEADERS

MTL_REPLENISH_HEADERS stores the header information for a replenishment count name. Each count name represents the replenishment information for a subinventory. The process status of a count name is stored in the PROCESS_STATUS column. The ERROR_FLAG stores the error status for the whole count name, if any.

MTL_REPLENISH_LINES

MTL_REPLENISH_LINES stores each line information for a replenishment header. The line information includes an item along with the count type and count quantity. The replenishment processor automatically populates further information such as sourcing information, reorder quantity, and account information along with the error statuses into this table upon the completion of processing the headers and lines.

The count types are On-hand Quantity, Order Maximum, and Order Quantity.

On-hand Quantity: the entered count quantity will be treated as the current on-hand quantity by the processor.

Order Maximum: users are not required to enter the count quantity. However, the processor will automatically reorder the maximum min-max quantity defined for the item regardless of the on-hand and supply quantity.

Order Quantity: the entered count quantity is treated as the reorder quantity.

However, the reorder quantity is subject to supplier constraints such as minimum order quantity, maximum order quantity, and fixed lot multiplier.

MTL_REPLENISH_LINES_INT

MTL_REPLENISH_LINES_INT is an interface table that allows users to populate the detailed replenishment line information. The information stored in this table along with the header information in MTL_REPLENISH_HEADERS_INT table will then be processed by the Replenishment Validator (INCRVL) before being loaded into the MTL_REPLENISH_LINES and MTL_REPLENISH_HEADERS tables respectively. The ERROR_FLAG stores the error statuses during validation.

MTL_RESERVATIONS

This table stores reservation information. Each record is a reservation that ties an item/organization combination with a demand source and a supply source. Demand source information comprises demand source type (Sales Order, Account, Account Alias, Inventory), demand source header, demand source line and demand source name. Supply source information comprises supply source type (Inventory, WIP jobs), supply source header, supply source line, supply source name and inventory controls (revision, lot, subinventory, locator).

MTL_RTG_ITEM_REVISIONS

MTL_RTG_ITEM_REVISIONS stores revision levels for routings. When a routing is defined a revision must be inserted into this table, so that every routing has at least one valid revision.

This table is analagous to MTL_ITEM_REVISIONS, but for routings instead of items. However, since engineering changes don't yet act on routings, routing revisions will never come directly from an ECO as they do for items.

MTL_RTG_ITEM_REVS_INTERFACE

MTL_RTG_ITEM_REVS_INTERFACE temporarily stores routing revisions before loading this information into Oracle Inventory. This table contains user friendly columns which allow you to easily enter your data as well as the corresponding foreign keys. Oracle Inventory will derive column values you do not enter, after performing the proper validation. For example, if you enter the ORGANIZATION_CODE, Oracle Inventory will fill in the corresponding ORGANIZATION_ID for you.

This is used by the BOM product.

MTL_SAFETY_STOCKS

MTL_SAFETY_STOCKS stores the safety stock information for an item that is not an MRP planned item. The SAFETY_STOCK_QUANTITY records the safety stock quantity effective from the EFFECTIVITY_DATE until the next EFFECTIVITY_DATE. Currently, there are three methods to derive the safety stock quantity. They are mean absolute deviation, user-defined percentage, and manual entry. The former two methods for deriving safety stock quantities are based on the forecast demand of the item. The SAFETY_STOCK_CODE represents how the safety stock is derived.

MTL_SALES_ORDERS

MTL_SALES_ORDERS stores Inventory's local definition of sales orders.

Unlike account numbers which are stored as flexfields in GL_CODE_COMBINATIONS, or purchase orders which are stored in PO_HEADERS, sales orders are not assumed to originate in any particular application. MTL_SALES_ORDERS exists for the purpose of mapping sales orders between other applications and Inventory. MTL_SALES_ORDERS is a key flexfield table with no structure defining column or set defining column. The flexfield code for this table is MKTS. Only one structure for the flexfield may be defined for any installation of Inventory. Inventory demand interface and demand manager will validate sales orders on segment values, and will create a new SALES_ORDER_ID when necessary.

MTL_SEASONALITY_INDICES

MTL_SEASONALITY_INDICES maintains the initial seasonality indices for for each calendar period. There could be 12 or 13 calendar periods in a year. The number of calendar periods in a year depends on if users compile the calendar by the 445 weekly quarter pattern, 544 weekly quarter pattern, 13 period calendar, or regular calendar months.

A seasonality index is an indication of the degree of seasonal variation for a product. An index is an estimate of how much the demand during the season will be above or below the average demand for the product. For example, 0.8 means 80 percent of the average demand for a particular season.

MTL_SECONDARY_INVENTORIES

MTL_SECONDARY_INVENTORIES is the definition table for the subinventory. A subinventory is a section of inventory, i.e., raw material, finished goods, etc. Subinventories are assigned to items (in a many to one relationship), indicating a list of valid places where this item will physically exist in inventory.

Other attributes include general ledger accounts, demand picking order, locator type, availability type, and reservable type.

You can also specify whether this subinventory is an expense or asset subinventory (ASSET_INVENTORY), or whether quantities are tracked (QUANTITY_TRACKED).

Database Triggers

Trigger Name : AX_MTL_SEC_INVENTORY_ARDI1
Trigger Time : AFTER
Trigger Level : ROW
Trigger Event : INSERT, DELETE

This trigger captures information needed to create subledger accounting events when Oracle Inventory and the set of books used is defined as a subledger in the Global Accounting Engine application. This trigger synchronizes the table MTL_SECONDARY_INVENTORIES and AX_SECONDARY_INVENTORIES. It ensure that a subinventory exists for every inventory organizations in AX_SECONDARY_INVENTORIES.

MTL_SECONDARY_LOCATORS

MTL_SECONDARY_LOCATORS stores all locators within a subinventory for a specific item.

These locators make up the valid list of locators when transacting that specific item to/from the subinventory, and the user has specified (in the Master Item window) that the item must use locators restricted to a pre-defined list.

MTL_SECONDARY_LOCS_INTERFACE

MTL_SECONDARY_LOCS_INTERFACE temporarily stores all locators within a subinventory for a specific item before loading this information into Oracle Inventory. Each subinventory is allowed one primary locator. A primary locator is used as a default locator in the transaction system.

This table contains user-friendly columns which allow you to easily enter your data as well as the corresponding foreign keys. Oracle Inventory will default column values you do not enter, after performing the proper validation. For example, if you enter the ITEM_NUMBER, Oracle Inventory will fill in the corresponding INVENTORY_ITEM_ID for you.

This table is not currently used.

MTL_SERIAL_NUMBERS

MTL_SERIAL_NUMBERS stores the definition and current status of all serial numbers in Oracle Inventory. These serial numbers are also used in other areas of Oracle Manufacturing.

A serial number can have one of four statuses:

- Defined but not used
- Resides in stores
- Issued out of stores
- Resides in intransit

The serial generation program populates this table, given the number of serial numbers to create and the starting number and prefix.

MTL_SERIAL_NUMBERS_TEMP

MTL_SERIAL_NUMBERS_TEMP holds temporary serial number transaction records for a parent record in MTL_MATERIAL_TRANSACTIONS_TEMP. Data in this table will eventually reside in MTL_UNIT_TRANSACTIONS after processing by the transaction processor. TRANSACTION_TEMP_ID joins to TRANSACTION_TEMP_ID in MTL_MATERIAL_TRANSACTIONS_TEMP when under serial control. If also under lot control it joins to MTL_TRANSACTION_LOTS_TEMP.SERIAL_TRANSACTION_TEMP_ID.

It is possible to have child records in this table without a parent record due to the autocommit feature of the Serial Number Entry form. Periodic deletion of irrelevant data from this table is desired.

MTL_SHORT_CHK_STATEMENTS

The MTL_SHORT_CHK_STATEMENTS table holds pre-generated SQL statements that are run when performing shortage checks for an organization. Each organization which has the Active Alerts and Notification Messages functionality enabled will have a summary and detail SQL statement stored in this table. The SQL statements are generated based on the shortage parameters which have been set up for the organization.

MTL_SHORT_CHK_TEMP

The MTL_SHORT_CHK_TEMP table is used to store the temporary results of material shortage queries. Each set of results is identified by a unique SEQ_NUM number. When the query results are no longer needed, the rows for that sequence number are purged from the table.

MTL_SO_RMA_INTERFACE

THIS TABLE IS OBSOLETE WITH THE NEW ORDER MANAGEMENT SYSTEM. IT IS USED ONLY FOR DATA MIGRATION FROM THIS TABLE TO THE NEW ORDER MANAGEMENT SYSTEM.

MTL_SO_RMA_INTERFACE is the interface table between Oracle Order Entry/Shipping and Oracle Inventory. When a customer decides to return some purchased items back to the supplier, a Return Material Authorization (RMA) is created in Order Entry. The RMA data is transferred from Order Entry to the interface table by a program which is run periodically. The data in this table is utilized by Oracle Inventory.

Three quantity related columns namely QUANTITY, RECEIVED_QUANTITY, DELIVERED_QUANTITY will at any time give you the total RMA quantity, total quantity received, and total units delivered into stores respectively. The INSPECTION_REQUIRED_FLAG determines whether the returned material requires to go through inspection. SALES_ORDER_ID is derived at the time of first receipt in Inventory.

MTL_SO_RMA_RECEIPTS

THIS TABLE IS OBSOLETE WITH THE NEW ORDER MANAGEMENT SYSTEM. IT IS USED ONLY FOR DATA MIGRATION FROM THIS TABLE TO THE NEW ORDER MANAGEMENT SYSTEM.

MTL_SO_RMA_RECEIPTS has a row for each RMA transaction in Inventory. Each row is stamped with a RMA_RECEIPT_ID. Two columns (RECEIVED_QUANTITY and ACCEPTED_QUANTITY) will give the user the quantity movement information. Every receipt into inspection will have a positive quantity in RECEIVED_QUANTITY. A direct delivery into stores will have a positive quantity in RECEIVED_QUANTITY and ACCEPTED_QUANTITY. The movement of material from inspection to stores will have a positive quantity in ACCEPTED_QUANTITY. A return from inspection will have a negative value in RECEIVED_QUANTITY and a direct return from stores will have negative value in both RECEIVED_QUANTITY and ACCEPTED_QUANTITY. Oracle Order Entry/Shipping has a program which periodically picks up data from this table and updates their RMA tables.

MTL_STATUS_ATTRIBUTE_VALUES

MTL_STATUS_ATTRIBUTE_VALUES stores the attributes values associated with an item status code. One record is created for each of the 'function enabling' attributes for each item status code that is defined. The function enabling attributes are: – Stockable – Transactable – Purchasable – Customer Order Enabled – Internal Order Enabled – Invoiceable – Build in WIP

The values stored in this table may be used to update item attribute values when the item's status attribute is changed.

MTL_SUMMARY_TEMP

MTL_SUMMARY_TEMP serves as a temporary table for transaction summaries. Records are inserted into this table by a stored procedure on the server side.

SESSION_ID is obtained from the session of the user. SUMMARY_TYPE is used to identify the type of transaction inquiry for a session.

Column Descriptions

MTL_SUPPLY

MTL_SUPPLY stores incoming supply information for an organization. This table forms one of the sources in Inventory's Demand-Supply form. There are four different types of supply captured in this table:

- 1) Approved Requisitions
- 2) Approved Purchase orders
- 3) Shipments from suppliers
- 4) Intransit shipments from another organization

Types 3 and 4 could be distinguished by the presence of data in the INTRANSIT_OWNING_ORGANIZATION_ID column, which identifies the ownership of the items in intransit. If this column is null then it means that the shipment supply is from a Vendor.

This information is used by the available to promise routine to derive the ATP information as appropriate. Quantities of items in intransit are also kept track of in the table.

Records in MTL_SUPPLY are created every time you approve a requisition or a PO or create an intransit shipment. One record of REQ type will be created for one requisition line when the requisition is approved. One record of PO type will be created per PO distribution when a PO is approved and one record per shipment line will be created when a shipment is created.

Records in MTL_SUPPLY will be recreated whenever there are transactions such as return to receiving, return to vendor or cancellation of purchase orders.

Records in MTL_SUPPLY are deleted every time you change the document status to not approved. For example, a PO would require approval if you change the line and shipment quantity. If such a PO is re-approved then the PO supply will be recreated for the new quantity.

The supply type code of a REQ supply record is changed to PO every time a requisition is autocreated. Similarly the supply type code is changed from PO to RECEIVING when a PO is fully received. If a PO is partially received then a supply with the supply type code of RECEIVING will be created for the quantity received. When the receipt is delivered the RECEIVING supply is deleted. SHIPMENT supply works in the same way as PO supply.

There is a database trigger on MTL_SUPPLY with the name MTL_SUPPLY_T. This trigger fires on insert, update or deletion of

records in MTL_SUPPLY. It inserts records into MRP_RELIEF_INTERFACE table.

Database Triggers

Trigger Name : MTL_SUPPLY_T
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : INSERT, UPDATE, DELETE

This trigger inserts rows into MRP_RELIEF_INTERFACE table. This information is used by the planning manager to relieve MPS planned orders or provide feedback for MRP planned orders. It fires on insert, update and delete of rows in MTL_SUPPLY. A new row is inserted only if the columns EXPECTED_DELIVERY_DATE, ITEM_ID, TO_ORGANIZATION_ID, TO_ORG_PRIMARY_QUANTITY are not null. The TRANSACTION_ID column in MRP_RELIEF_INTERFACE table is populated using the sequence MRP_RELIEF_INTERFACE_S.

MTL_SUPPLY_DEMAND_TEMP

MTL_SUPPLY_DEMAND_TEMP serves as a temporary table for ATP and supply/demand detail queries. SEQ_NUM is created by the routines to distinguish records from other queries. Furthermore, RECORD_TYPE is used to distinguish an ATP record from a supply/demand record for the same query (i.e., same SEQ_NUM). In an ATP query, both ATP and supply/demand records are populated into this table. Thus, when performing an ATP query, RECORD_TYPE is internally set as 'ATP' and D_COLUMNS and N_COLUMNS are generic column names for storing character, date and number information respectively.

MTL_SYSTEM_ITEMS_B

MTL_SYSTEM_ITEMS_B is the definition table for items. This table holds the definitions for inventory items, engineering items, and purchasing items. You can specify item-related information in fields such as: Bill of Material, Costing, Purchasing, Receiving, Inventory, Physical attributes, General Planning, MPS/MRP Planning, Lead times, Work in Process, Order Management, and Invoicing.

You can set up the item with multiple segments, since it is implemented as a flexfield. Use the standard 'System Items' flexfield that is shipped with the product to configure your item flexfield. The flexfield code is MSTK.

The primary key for an item is the INVENTORY_ITEM_ID and ORGANIZATION_ID. Therefore, the same item can be defined in more than one organization.

Each item is initially defined in an item master organization. The user then assigns the item to other organizations that need to recognize this item; a row is inserted for each new organization the item is assigned to. Many columns such as MTL_TRANSACTIONS_ENABLED_FLAG and BOM_ENABLED_FLAG correspond to item attributes defined in the MTL_ITEM_ATTRIBUTES table. The attributes that are available to the user depend on which Oracle applications are installed. The table MTL_ATTR_APPL_DEPENDENCIES maintains the relationships between item attributes and Oracle applications.

Two unit of measure columns are stored in MTL_SYSTEM_ITEMS table. PRIMARY_UOM_CODE is the 3-character unit that is used throughout Oracle Manufacturing. PRIMARY_UNIT_OF_MEASURE is the 25-character unit that is used throughout Oracle Purchasing.

Items now support multilingual description. MLS is implemented with a pair of tables: MTL_SYSTEM_ITEMS_B and MTL_SYSTEM_ITEMS_TL. Translations table (MTL_SYSTEM_ITEMS_TL) holds item descriptions in multiple languages. DESCRIPTION column in the base table (MTL_SYSTEM_ITEMS_B) is for backward compatibility and is maintained in the installation base language only.

Database Triggers

Trigger Name : MTL_SYSTEM_ITEMS_T6_BOM
 Trigger Time : AFTER
 Trigger Level : ROW
 Trigger Event : INSERT

This trigger creates categories corresponding to product family items being created. It also assigns product family items to their corresponding categories. The trigger uses data that has been stored in the BOM_PFI_PVT package PL/SQL tables by the row level trigger.

Oracle Proprietary, Confidential Information--Use Restricted by Contract

Trigger Name : MTL_SYSTEM_ITEMS_T1_BOM
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : INSERT

This trigger stores product family item identifier used later by the statement level trigger for creation of the corresponding category when a new product family item is defined. It makes calls to the BOM_PFI_PVT package procedures.

Trigger Name : MTL_SYSTEM_ITEMS_B_T2_BOM
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : DELETE

This trigger stores corresponding category identifier that is used later by the statement level trigger for deletion of the category when the product family item is deleted. It makes calls to BOM_PFI_PVT package procedures.

Trigger Name : MTL_SYSTEM_ITEMS_T3_BOM
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : UPDATE

This trigger performs the following functions depending on conditions: 1. Creates product family category when item attribute BOM_ITEM_TYPE is updated to 5. 2. When the item attribute BOM_ITEM_TYPE is changed from 5 to any other value, the trigger stores corresponding category identifier for later deletion of the category by the statement level trigger. 3. Removes an item assignment to the corresponding product family category when the PRODUCT_FAMILY_ITEM_ID column of that item is changed. 4. When the PRODUCT_FAMILY_ITEM_ID column is changed to non-null, stores category ID in the BOM_PFI_PVT package PL/SQL table for an item assignment to that category later by the statement-level trigger.

Trigger Name : MTL_SYSTEM_ITEMS_T4_BOM
Trigger Time : AFTER
Trigger Level : STATEMENT
Trigger Event : UPDATE

This trigger performs the following functions depending on updates of the BOM_ITEM_TYPE and PRODUCT_FAMILY_ITEM_ID columns: 1. Creates categories corresponding to product family items. 2. Assigns new product family items to their corresponding categories. 3. Deletes product family categories. The trigger uses data that has been stored in the BOM_PFI_PVT package PL/SQL tables by the row level trigger.

Trigger Name : MTL_SYSTEM_ITEMS_T5_BOM
Trigger Time : AFTER
Trigger Level : ROW
Trigger Event : DELETE

This trigger deletes categories corresponding to product family items being deleted. The trigger uses data that has been stored in the BOM_PFI_PVT package PL/SQL tables by the row level trigger.

Trigger Name : MTL_SYSTEM_ITEMS_T1
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : UPDATE

The trigger is executed when the COSTING_ENABLED_FLAG field in the MTL_SYSTEM_ITEMS table is modified from Yes to No or vice versa. Before updating COSTING_ENABLED_FLAG field, the trigger performs the following tasks for each record that is modified:

- Insert a record into CST_ITEM_COSTS table if
COSTING_ENABLED_FLAG field is changed from No to Yes.
- Delete a record from CST_ITEM_COSTS table if
COSTING_ENABLED_FLAG field is changed from Yes to No.

Trigger Name : MTL_SYSTEM_ITEMS_B_T2_IBE
Trigger Time : AFTER
Trigger Level : ROW
Trigger Event : DELETE

This trigger calls iStore procedures to update relationships, section-items and search tables that depend on MTL_SYSTEM_ITEMS_B table.

Trigger Name : MTL_SYSTEM_ITEMS_B_T3_IBE
Trigger Time : AFTER
Trigger Level : ROW
Trigger Event : UPDATE

This trigger calls iStore procedures to update relationships and section-items tables that depend on MTL_SYSTEM_ITEMS_B table.

MTL_SYSTEM_ITEMS_B_EFC

MTL_SYSTEM_ITEMS_B_EFC is used exclusively as an archive table for the "Euro as a functional currency" project. It mirrors the table MTL_SYSTEM_ITEMS_B prior to conversion to the euro currency.

MTL_SYSTEM_ITEMS_INTERFACE

MTL_SYSTEM_ITEMS_INTERFACE temporarily stores the definitions for inventory items, engineering items and purchasing items before loading this information into Oracle Inventory.

This table contains user friendly columns which allow you to easily enter your data as well as their corresponding foreign keys. Oracle Inventory will default column values you do not enter, after performing the proper validation. For example, you enter the ORGANIZATION_CODE, and Oracle Inventory will fill in the corresponding ORGANIZATION_ID for you. It is strongly recommended that users enter the segment information for the item instead of the item number.

You can also specify a TEMPLATE_ID to copy item attributes from.

Also, if you enter REVISION, Oracle Inventory will insert a record into MTL_ITEM_REVISIONS for your item.

MTL_SYSTEM_ITEMS_TL

MTL_SYSTEM_ITEMS_TL is a table holding translated Description column for Items.

Items now support multilingual description. MLS is implemented with a pair of tables: MTL_SYSTEM_ITEMS_B and MTL_SYSTEM_ITEMS_TL. Translations table (MTL_SYSTEM_ITEMS_TL) holds item descriptions in multiple languages.

Database Triggers

Trigger Name : MTL_SYSTEM_ITEMS_TL_TA_IBE
Trigger Time : AFTER
Trigger Level : ROW
Trigger Event : INSERT, UPDATE, DELETE

This trigger calls iStore procedures to update search table that depends on MTL_SYSTEM_ITEMS_TL table.

MTL_TRANSACTIONS_INTERFACE

MTL_TRANSACTIONS_INTERFACE is the interface point between non-Inventory applications and the Inventory transaction module.

Transaction Manager concurrent program polls this table at a user-specified process interval, and submits the Transaction Workers to process them. Processing consists of data derivation, validation, and transfer of records from MTL_TRANSACTIONS_INTERFACE, MTL_TRANSACTION_LOTS_INTERFACE, and MTL_SERIAL_NUMBERS_INTERFACE into their respective TEMP tables, from where they are processed by the transaction processor.

MTL_TRANSACTIONS_INTERFACE follows the Inventory standard for interfacing flexfields. Any parameters which are represented by flexfields may be entered in the interface table either as code combination identifiers or as flexfield segment combinations. The Transaction Worker will validate that any given identifiers are valid and enabled. If no identifier is given, then the Transaction Worker will validate and decode the flexfield segment values, and where appropriate, create new flexfield combinations in the database.

The Transaction Manager picks up the rows to process based on the LOCK_FLAG, TRANSACTION_MODE, PROCESS_FLAG to manipulate the records in the table. Only records with TRANSACTION_MODE of 3, LOCK_FLAG of '2', and PROCESS_FLAG of '1' will be picked up by the Transaction Manager and assigned to a Transaction Worker. If a record fails to process completely, then PROCESS_FLAG will be set to '3' and ERROR_CODE and ERROR_EXPLANATION will be populated with the cause for the error.

MTL_TRANSACTION_ACCOUNTS

MTL_TRANSACTION_ACCOUNTS holds the accounting information for each material transaction in MTL_MATERIAL_TRANSACTIONS. Oracle Inventory uses this information to track the financial impact of your quantity moves.

The two tables are joined by the TRANSACTION_ID, and in most instances, there are at least two account rows for every material transaction. For some transactions, such as expense items or expense subinventories, you may not have any accounting. You should not join these two tables by ORGANIZATION_ID because inter-organizations transfers occur across organizations.

Each row in this table represents a debit or credit accounting entry, and the sum of all rows for a given transaction identifier should be zero. Each row includes the account, transaction date, transaction value, purpose (ACCOUNTING_LINE_TYPE), and the source of the charges (TRANSACTION_SOURCE_TYPE_ID).

The TRANSACTION_VALUES and BASE_TRANSACTION_VALUES are transferred to the GL_INTERFACE_TABLE through the period close or GL transfer process, and until this process is run, the GL_BATCH_ID is -1.

The index MTL_TRANSACTION_ACCOUNTS_N2 is used only during install and upgrade, and will be dropped during the course thereof, but is included here for completeness. The index is named such to coincide with the equivalent index in R9.

Database Triggers

Trigger Name : AX_MTL_TRANS_ACCOUNTS_BRI1
 Trigger Time : BEFORE
 Trigger Level : ROW
 Trigger Event : INSERT

This trigger captures information needed to create subledger accounting events when Oracle Inventory and the set of books used is defined as a subledger in the Global Accounting Engine application. This trigger prevents an inventory transaction from being posted twice to GL, once in Global Accounting Engine and again by Oracle Inventory.

MTL_TRANSACTION_ACCOUNTS_EFC

MTL_TRANSACTION_ACCOUNTS_EFC is used exclusively as an archive table for the "Euro as a functional currency" project. It mirrors the table MTL_TRANSACTION_ACCOUNTS prior to conversion to the euro currency.

MTL_TRANSACTION_LOTS_TEMP

MTL_TRANSACTION_LOTS_TEMP stores lot number information for transactions in the MTL_MATERIAL_TRANSACTIONS_TEMP table.

Many lot number records may be specified for a given transaction record. TRANSACTION_TEMP_ID joins to TRANSACTION_TEMP_ID in MTL_MATERIAL_TRANSACTIONS_TEMP.

SERIAL_TRANSACTION_TEMP_ID joins to TRANSACTION_TEMP_ID in MTL_SERIAL_NUMBERS_TEMP when also under serial control

It is possible to have child records in this table without a parent record due to the autocommit feature of the Lot Entry window. Periodic deletion of irrelevant data from this table is desired.

MTL_TRANSACTION_LOT_NUMBERS

MTL_TRANSACTION_LOT_NUMBERS stores lot number information for transactions in the MTL_MATERIAL_TRANSACTIONS table.

TRANSACTION_ID joins to

MTL_MATERIAL_TRANSACTIONS.TRANSACTION_ID.

SERIAL_TRANSACTION_ID joins to

MTL_UNIT_TRANSACTIONS.TRANSACTION_ID when also under serial control.

MTL_TXN_REQUEST_LINES

The table MTL_TXN_REQUEST_LINES stores all of the move order lines. The lines are requests to move some quantity of an item from a source location to a destination location or account. Each move order line must be tied to a specific move order header. When a line is detailed or pick released, the quantity detailed is updated appropriately and transaction lines are created in MTL_MATERIAL_TRANSACTIONS_TEMP. When the transaction lines are transacted, the quantity delivered is updated.

MTL_TXN_SOURCE_TYPES

MTL_TXN_SOURCE_TYPES contains information about valid transaction source type in the system. There are two kinds of transaction source types. System transaction source types are those seeded when the system is installed, bear source type identifiers of 1 through 13 and use system validation. User defined transaction source types have identifiers higher than 100, and may have validation set up through the use of the descriptive flex context in the 'Transaction Source' descriptive flexfield.

Transaction source types are used in defining user transaction types, which would in turn be used in different inventory transactions.

MTL_UNITS_OF_MEASURE_TL

MTL_UNITS_OF_MEASURE_TL is the definition table for both the 25-character and the 3-character units of measure. The base_uom_flag indicates if the unit of measure is the primary unit of measure for the uom_class. Oracle Inventory uses this table to keep track of the units of measure used to transact an item. This table is also used by Oracle Purchasing, Oracle Order Management and Oracle Shipping Execution.

MTL_UNIT_TRANSACTIONS

MTL_UNIT_TRANSACTIONS stores a record of every material transaction of a serialized unit in Inventory. Records are inserted into this table through the transaction processor.

Many serial numbers may be specified for a given transaction record. TRANSACTION_ID joins to MTL_MATERIAL_TRANSACTIONS.TRANSACTION_ID when only under serial control. TRANSACTION_ID joins to MTL_TRANSACTION_LOT_NUMBERS.SERIAL_TRANSACTION_ID when also under lot control.

MTL_UOM_CLASSES_TL

MTL_UOM_CLASSES is the definition of the unit of measure classes. A class is a category to which units of measure are assigned. Oracle Inventory defines this table, and it is used by Oracle Purchasing, Oracle Order Management and Oracle Shipping Execution.

MTL_UOM_CLASS_CONVERSIONS

MTL_UOM_CLASS_CONVERSIONS is where conversions between base units of measure are defined for an item. A base unit of measure is the primary unit for a class.

MTL_UOM_CONVERSIONS

MTL_UOM_CONVERSIONS stores conversion rates between non-base units of measure and their base unit. The non-base units of measure are stored in the table.

The default_conversion_flag indicates that the conversion being defined is 1) associated with a specific item and 2) the conversion between units of measure has already been defined as a standard conversion with the same conversion rate.

MTL_UPDATE_RECORDS_TEMP

MTL_UPDATE_RECORDS_TEMP is a table used exclusively for the item attribute copy form. It holds the unique id of records in MTL_SYSTEM_ITEMS_B.

Column Descriptions

| Name | Null? | Type | Description |

MTL_USER_DEMAND

MTL_USER_DEMAND provides an interface mechanism for users to populate their own demand information, ie, the demand sources that are not predefined by Oracle Inventory, to be included in ATP calculation. Once the table is populated, the information can be viewed by the Supply / Demand Detail window. Furthermore, users can utilize ATP rules to include/exclude this demand source in the ATP calculation. If "Include User-Defined Demand" option in the ATP rule is set to Yes, then the ATP calculation will include the demand information stored in this table. Otherwise, no demand information in this table is included.

The SOURCE_TYPE_ID column stores the source type, for example, 2 for sales order, 3 for account number, 4 for WIP job/schedule and 5 for account alias. SOURCE_ID stores the sources for source types. This column is context sensitive; it depends on source type. For example, if the source type is Sales Order, then this column represents sales order id. If source type is WIP job/schedule, this means WIP entity id. If source type is account number, then source id should store the GL code combination id for the account number.

MTL_USER_SUPPLY

MTL_USER_SUPPLY provides an interface mechanism for users to populate their own supply information, ie, the supply sources that are not predefined by Oracle Inventory, to be included in ATP calculation. Once the table is populated, the information can be viewed by the Supply / Demand Detail window. Furthermore, users can utilize ATP rules to include/exclude this supply source in the ATP calculation. If "Include User-Defined Supply" option in the ATP rule is set to Yes, then the ATP calculation will include the supply information stored in this table, otherwise, no supply information in this table is included.

The SOURCE_TYPE_ID column stores the source type, for example, 1 for purchase order, 3 for account number, 4 for WIP job/schedule and 5 for account alias. SOURCE_ID stores the sources for source types. This column is context sensitive, it depends on source type. For example, if the source type is Purchase Order, then this column represents purchasing header id. If source type is WIP job/schedule, this means WIP entity id. ORG_ACCT_PERIODS

ORG_ACCT_PERIODS holds the open and closed financial periods for organizations. When a period is opened, the period open form (INVTGPO) pulls in the next available period from the GL table GL_PERIODS. ORG_ACCT_PERIODS holds the relevant data, such as period start, end and close dates. Note that only postable periods will be brought over. You may create non-postable periods in Oracle General Ledger or in the GL forms provided with Oracle Inventory. If data exists in the PERIOD_CLOSE_DATE column, then the period has been closed and no more transactions can be made against the closed period. The combination of the PERIOD_CLOSE_DATE and OPEN_FLAG columns reflects the status of a period. When OPEN_FLAG = 'P', it means the period close is processing. When it equals 'N', the period close process is completed. When OPEN_FLAG is 'Y' and PERIOD_CLOSE_DATE is null, it means the period is open. Otherwise, it implies the period close process has failed.

ORG_GL_BATCHES

ORG_GL_BATCHES holds history rows for every batch of transactions that have been interfaced to the GL_INTERFACE table. When you run the GL Transfer or Period Close function, a new row will be inserted into this table, using the next GL_BATCH_ID number. This row contains the transfer date and the ACCT_PERIOD_ID from ORG_ACCT_PERIODS. The GL_BATCH_ID column in the accounting transaction tables is updated with this GL_BATCH_ID, and this id prevents the accounting transaction from being interfaced twice to the GL_INTERFACE table. Upon launching the GL Transfer function, the GL_BATCH_ID is set to 0 which represents "Processing" status. The GL_BATCH_ID is set to a positive number when successfully completed and to a negative number when failure occurs. For Oracle Inventory, the accounting table is MTL_TRANSACTION_ACCOUNTS; for Oracle Work In Process, the accounting table is WIP_TRANSACTION_ACCOUNTS.

PJM_UNIT_NUMBERS

PJM_UNIT_NUMBERS holds unique End Item Model/Unit Numbers for model/unit number effectivity controlled end items. The End Item Model/Unit Number is an alphanumeric string that typically includes a prefix and a number in sequence; for example, FAN-0001. The unit numbers defined for end items must be unique across organizations and across items. This table corresponds to the Maintain Model/Unit Numbers window.

PO_AGENTS

PO_AGENTS contains information about buyers and purchasing managers. You need one row for each employee who has purchasing responsibilities in your organization. You define a buyer by entering a default Item Category and Ship-To Location.

Oracle Purchasing uses this information to determine active buyers and to provide defaults in the Find Requisitions Lines window. When creating a purchase order, you can use the list of values to choose a buyer you defined in this table.

You enter buyer information in the Buyers window.

The primary key AGENT_ID has the same value as the EMPLOYEE_ID in the HR_EMPLOYEES view for the corresponding employee.

PO_DISTRIBUTIONS_ALL

PO_DISTRIBUTIONS_ALL contains accounting distribution information for a purchase order shipment line. You need one row for each distribution line you attach to a purchase order shipment. There are four types of documents using distributions in Oracle Purchasing:

- Standard Purchase Orders
- Planned Purchase Orders
- Planned Purchase Order Releases
- Blanket Purchase Order Releases

Each row includes the destination type, requestor ID, quantity ordered and deliver-to location for the distribution.

Oracle Purchasing uses this information to record accounting and requisition information for purchase orders and releases.

PO_DISTRIBUTIONS_ALL is one of five tables storing purchase order and release information.

Some columns in PO_DISTRIBUTIONS_ALL contain information only if certain conditions exist:

- If you autocreate this accounting distribution from a requisition, REQ_DISTRIBUTION_ID corresponds to the ID of the requisition distribution you copy on the purchase order.
- If you use a foreign currency on your purchase order, Oracle Purchasing stores currency conversion information in RATE and RATE_DATE.

Oracle Proprietary, Confidential Information--Use Restricted by Contract

- If you use encumbrance, GL_ENCUMBERED_DATE and GL_ENCUMBERED_PERIOD_NAME contain encumbrance information Oracle Purchasing uses to create journal entries in Oracle General Ledger.
- If you do not autcreate the purchase order from online requisitions, REQ_LINE_REFERENCE_NUM and REQ_HEADER_REFERENCE_NUM contain the requisition number and requisition line number of the corresponding paper requisition. These two columns are not foreign keys to another table.
- If the distribution corresponds to a blanket purchase order release, PO_RELEASE_ID identifies this release.
- If SOURCE_DISTRIBUTION_ID has a value, the distribution is part of a planned purchase order release.
- If you cancel the distribution, Oracle Purchasing automatically updates QUANTITY_CANCELLED or GL_CANCELLED_DATE. Oracle Purchasing also enters UNENCUMBERED_AMOUNT if you use encumbrance.

You enter distribution information in the Distributions window, accessible through the Purchase Orders and Releases windows.

Database Triggers

Trigger Name : PO_MRC_DISTRIBUTIONS_BIUD
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : INSERT, UPDATE, DELETE

This MRC trigger only exists when you install the Multiple Reporting Currencies feature. It is executed when you perform an insert, update, or delete statement on the table PO_DISTRIBUTIONS_ALL. For each record being inserted/updated/deleted in PO_DISTRIBUTIONS_ALL, this trigger inserts/updates/deletes corresponding reporting currency records in the MRC subtable, PO_MC_DISTRIBUTIONS. In addition, this trigger also populates the MRC VARCHAR2 columns in PO_DISTRIBUTIONS_ALL.

PO_HAZARD_CLASSES_B

PO_HAZARD_CLASSES_B contains information about the hazardous materials classes you use in your business. Oracle Purchasing lets you record hazard class information to let you comply with Section 19 of the International Safety Rating System. You need one row for each hazard class you use.

Oracle Purchasing uses this information to let you provide hazard class information on your purchase orders, requisitions, RFQs, and quotations.

PO_HEADERS_ALL

PO_HEADERS_ALL contains header information for your purchasing documents. You need one row for each document you create. There are six types of documents that use PO_HEADERS_ALL:

- RFQs
- Quotations
- Standard purchase orders
- Planned purchase orders
- Blanket purchase orders
- Contracts

Each row contains buyer information, supplier information, brief notes, foreign currency information, terms and conditions information, and the status of the document.

Oracle Purchasing uses this information to record information that is related to a complete document.

PO_HEADER_ID is the unique system-generated primary key and is invisible to the user. SEGMENT1 is the system-assigned number you use to identify the document in forms and reports. Oracle Purchasing generates SEGMENT1 using the PO_UNIQUE_IDENTIFIER_CONT_ALL table if you choose to let Oracle Purchasing generate document numbers for you. SEGMENT1 is not unique for the entire table. Different document types can share the same numbers. You can uniquely identify a row in PO_HEADERS_ALL using SEGMENT1 and TYPE_LOOKUP_CODE or using

PO_HEADER_ID.

If APPROVED_FLAG is 'Y', the purchase order is approved. If your document type is a blanket purchase order, contract purchase order, RFQ, or quotation, Oracle Purchasing uses START_DATE and END_DATE to store the valid date range for the document. Oracle Purchasing only uses BLANKET_TOTAL_AMOUNT for blanket purchase orders or contract purchase orders.

If you autocreate a quotation from an RFQ using the Copy Document window, Oracle Purchasing stores the foreign key to your original RFQ in FROM_HEADER_ID. Oracle Purchasing also uses FROM_TYPE_LOOKUP_CODE to indicate that you copied the quotation from an RFQ.

Oracle Purchasing does not use SUMMARY_FLAG and ENABLED_FLAG. Because future versions of Oracle Purchasing will use them, SUMMARY_FLAG and ENABLED_FLAG should always be 'N' and 'Y' respectively.

You enter document header information in the Header region of the Purchase Orders, RFQs, and Quotations windows.

Database Triggers

Trigger Name : PO_MRC_HEADERS_BIUD
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : INSERT, UPDATE, DELETE

This MRC trigger only exists when you install the Multiple Reporting Currencies feature. It is executed when you perform an insert, update, or delete statement on the table PO_HEADERS_ALL. For each record being inserted/updated/deleted in PO_HEADERS_ALL, this trigger inserts/updates/deletes corresponding reporting currency records in the MRC subtable, PO_MC_HEADERS. In addition, this trigger also populates the MRC VARCHAR2 columns in PO_HEADERS_ALL.

PO_LINES_ALL

PO_LINES_ALL stores current information about each purchase order line. You need one row for each line you attach to a document. There are five document types that use lines:

- RFQs
- Quotations
- Standard purchase orders
- Blanket purchase orders
- Planned purchase orders

Each row includes the line number, the item number and category, unit, price, tax information, matching information, and quantity ordered for the line. Oracle Purchasing uses this information to record and update item and price information for purchase orders, quotations, and RFQs.

PO_LINE_ID is the unique system-generated line number invisible to the user. LINE_NUM is the number of the line on the purchase order. Oracle Purchasing uses CONTRACT_NUM to reference a contract purchase order from a standard purchase order line. Oracle Purchasing uses ALLOW_PRICE_OVERRIDE_FLAG, COMMITTED_AMOUNT, QUANTITY_COMMITTED, MIN_RELEASE_AMOUNT only for blanket and planned purchase order lines.

The QUANTITY field stores the total quantity of all purchase order shipment lines (found in PO_LINE_LOCATIONS_ALL).

PO_LINE_LOCATIONS_ALL

PO_LINE_LOCATIONS_ALL contains information about purchase order shipment schedules and blanket agreement price breaks. You need one row for each schedule or price break you attach to a document line. There are seven types of documents that use shipment schedules:

- RFQs
- Quotations
- Standard purchase orders
- Planned purchase orders
- Planned purchase order releases
- Blanket purchase orders
- Blanket purchase order releases

Each row includes the location, quantity, and dates for each shipment schedule. Oracle Purchasing uses this information to record delivery schedule information for purchase orders, and price break information for blanket purchase orders, quotations and RFQs.

PO_RELEASE_ID applies only to blanket purchase order release shipments. PO_RELEASE_ID identifies the release on which you placed this shipment.

SOURCE_SHIPMENT_ID applies only to planned purchase order

Oracle Proprietary, Confidential Information--Use Restricted by Contract

release shipments. It identifies the planned purchase order shipment you chose to release from.

PRICE_OVERRIDE always equals the purchase order line price for standard purchase order shipments. For blanket and planned purchase orders, PRICE_OVERRIDE depends on the values of the ALLOW_PRICE_OVERRIDE_FLAG and NOT_TO_EXCEED_PRICE in the corresponding row in PO_LINES_ALL:

- If ALLOW_PRICE_OVERRIDE_FLAG is 'N', then PRICE_OVERRIDE equals UNIT_PRICE in PO_LINES_ALL.
- If ALLOW_PRICE_OVERRIDE_FLAG is 'Y', the PRICE_OVERRIDE can take any value that is smaller than NOT_TO_EXCEED_PRICE in PO_LINES_ALL.

The QUANTITY field corresponds to the total quantity ordered on all purchase order distribution lines (found in PO_DISTRIBUTIONS_ALL).

Oracle Purchasing automatically updates QUANTITY_RECEIVED, QUANTITY_ACCEPTED, and QUANTITY_REJECTED when you receive, return, or inspect goods or services. Oracle Payables automatically updates QUANTITY_BILLED when you match an invoice with a purchase order shipment. Oracle Purchasing automatically updates QUANTITY_CANCELLED when you cancel a purchase order shipment.

Oracle Purchasing sets APPROVED_FLAG to 'Y' when you approve the corresponding purchase order if there are no problems associated with the shipment and its related distributions.

Oracle Purchasing sets ENCUMBERED_FLAG to 'Y' and enters the ENCUMBERED_DATE when you approve a purchase order if you use encumbrance.

PO_RELEASES_ALL

PO_RELEASES_ALL contains information about blanket and planned purchase order releases. You need one row for each release you issue for a blanket or planned purchase order. Each row includes the buyer, date, release status, and release number. Each release must have at least one purchase order shipment (PO_LINE_LOCATIONS_ALL). RELEASE_NUM is the number you assign to the release.

PO_REQUISITIONS_INTERFACE_ALL

PO_REQUISITIONS_INTERFACE_ALL contains requisition information from other applications. Each row includes all the information necessary to create approved or unapproved requisitions in Oracle Purchasing. The Oracle Purchasing Requisition Import feature uses this information to create new requisition headers, lines and distributions.

You use the Submit Request window to launch the Requisition Import program for any set of rows. You identify the set of rows you want to import by setting the INTERFACE_SOURCE_CODE and BATCH_ID columns appropriately in the interface table.

The Requisition Import program validates your data, derives or defaults additional information and writes an error message for every validation that fails into the PO_INTERFACE_ERRORS table. Then the program groups and numbers requisition lines according to the criteria you specify in the GROUP_CODE and REQ_NUMBER_SEGMENT1 columns, and creates new requisitions.

Most of the columns in the PO_REQUISITIONS_INTERFACE_ALL table are identical to the corresponding columns in the PO_REQUISITIONS_HEADERS_ALL, PO_REQUISITION_LINES_ALL and PO_REQ_DISTRIBUTIONS_ALL tables. You can additionally enter reference information in the INTERFACE_SOURCE_LINE_ID column.

PO_REQUISITION_HEADERS_ALL

PO_REQUISITION_HEADERS_ALL stores information about requisition headers. You need one row for each requisition header you create. Each row contains the requisition number, preparer, status, and description.

REQUISITION_HEADER_ID is the unique system-generated requisition number. REQUISITION_HEADER_ID is invisible to the user. SEGMENT1 is the number you use to identify the requisition in forms and reports. Oracle Purchasing generates SEGMENT1 using the PO_UNIQUE_IDENTIFIER_CONTROL table if you choose to let Oracle Purchasing generate requisition numbers for you.

PO_REQUISITION_HEADERS_ALL is one of three tables storing requisition information. PO_REQUISITION_HEADERS_ALL corresponds to the Header region of the Requisitions window.

SEGMENT1 provides unique values for each row in the table in addition to REQUISITION_HEADER_ID.

PO_REQUISITION_LINES_ALL

PO_REQUISITION_LINES stores information about requisition lines. You need one row for each requisition line you create. Each row contains the line number, item number, item category, item description, need-by date, deliver-to location, item quantities, units, prices, requestor, notes, and suggested supplier information for the requisition line.

LINE_LOCATION_ID identifies the purchase order shipment line on which you placed the requisition. LINE_LOCATION_ID is null if you have not placed the requisition line on a purchase order. BLANKET_PO_HEADER_ID and BLANKET_PO_LINE_NUM store the suggested blanket purchase agreement or catalog quotation line information for the requisition line. PARENT_REQ_LINE_ID contains the REQUISITION_LINE_ID from the original requisition line if you exploded or multisourced this requisition line.

PO_REQUISITION_LINES is one of three tables storing requisition information. This table corresponds to the Lines region of the Requisitions window.

Database Triggers

Trigger Name : JL_BR_PO_IMPORT_REQUISITIONS
 Trigger Time : BEFORE
 Trigger Level : ROW
 Trigger Event : INSERT

This trigger is executed on insert of a row in PO_REQUISITION_LINES_ALL when TRANSACTION_REASON_CODE is null. TRANSACTION_REASON_CODE is populated from the inventory item, if available, or from PO_SYSTEM_PARAMETERS. This is done only if the country is Brazil (country_code = 'BR') and the Latin America Localizations for Brazil (product_code = 'JL') is installed. For Brazilian PO localizations, TRANSACTION_REASON_CODE is a required field. In all other cases, this trigger does nothing. new.transaction_reason_code is null

PO_SYSTEM_PARAMETERS_ALL

PO_SYSTEM_PARAMETERS_ALL stores default, control, and option information you provide to customize Oracle Purchasing to your company's needs. PO_SYSTEM_PARAMETERS_ALL corresponds to the Purchasing Options window. This table has no primary key. The table should never have more than one row.

PO_UN_NUMBERS_B

PO_UN_NUMBERS_B contains information about the United Nations hazardous materials classification numbers that you use in your business. Oracle Purchasing lets you record UN numbers information to let you comply with Section 19 of the International Safety Rating System. You need one row for each UN number you use.

Oracle Purchasing uses this information to let you provide UN number information on your purchase orders, requisitions, RFQs, and quotations.

PO_VENDORS

PO_VENDORS stores information about your suppliers. You need one row for each supplier you define. Each row includes the supplier name as well as purchasing, receiving, payment, accounting, tax, classification, and general information. Oracle Purchasing uses this information to determine active suppliers. VENDOR_ID is the unique system-generated receipt header number invisible to the user. SEGMENT1 is the system-generated or manually assigned number you use to identify the supplier in forms and reports. Oracle Purchasing generates SEGMENT1 using the PO_UNIQUE_IDENTIFIER_CONTROL table if you choose to let Oracle Purchasing generate supplier numbers for you. This table is one of three tables that store supplier information. PO_VENDORS corresponds to the Suppliers window.

PO_VENDOR_SITES_ALL

PO_VENDOR_SITES_ALL stores information about your supplier sites. You need a row for each supplier site you define. Each row includes the site address, supplier reference, purchasing, payment, bank, and general information. Oracle Purchasing uses this information to store supplier address information.

This table is one of three tables that store supplier information. PO_VENDOR_SITES_ALL corresponds to the Sites region of the Suppliers window.

RA_CUST_TRX_TYPES_ALL

This table stores information about each transaction type used for invoices, commitments and credit memos. Each row includes AutoAccounting information as well as standard defaults for the resulting invoices. POST_TO_GL stores 'Y' for Yes and 'N' for No to indicate whether this transaction can post to your general ledger. ACCOUNTING_AFFECT_FLAG stores 'Y' for Yes and 'N' for No to indicate whether this transaction can update your open receivables balances. If this is 'Y', you can see this transactions in your agings. TYPE contains 'INV' for invoices, 'CM' for credit memos, 'DM' for debit memos, 'DEP' for deposits, and 'GUAR' for guarantees. If AutoAccounting is based on transaction type, GL_ID_REV, GL_ID_FREIGHT, and GL_ID_REC stores the default revenue, freight, and receivables accounts. STATUS and CREDIT_MEMO_TYPE_ID are required even though they are null allowed. The primary key for this table is CUST_TRX_TYPE_ID.

RA_RULES

This table stores invoicing and accounting rules. You need one row for each accounting rule you define. Oracle Receivables provides two invoicing rules: ADVANCED INVOICE and ARREARS INVOICE. Oracle Receivables uses this information to create invoices and to schedule revenue recognition for invoices imported using AutoInvoice. Oracle Receivables stores revenue recognition schedules in RA_RULE_SCHEDULES.

RCV_LOTS_INTERFACE

RCV_LOTS_INTERFACE holds temporary lot number transaction records for a parent record in the RCV_TRANSACTIONS_INTERFACE table. Data in the RCV_TRANSACTIONS_INTERFACE table will eventually reside in RCV_LOT_TRANSACTIONS after being processed by the receiving transaction processor.

It is possible to have child records in this table without a parent record due to the automatic save feature in the Lot Entry and Serial Number forms. The receiving transaction processor deletes these orphan rows as part of normal processing.

RCV_SERIALS_INTERFACE

RCV_SERIALS_INTERFACE holds temporary serial number transaction records for a parent record in RCV_TRANSACTIONS_INTERFACE. Data in the RCV_TRANSACTIONS_INTERFACE table will eventually reside in RCV_SERIAL_TRANSACTIONS after they are processed by the transaction processor.

It is possible to have child records in this table without a parent record due to the automatic save feature in the Lot Entry and Serial Numbers forms. The receiving transaction processor deletes orphan rows during normal processing.

RCV_SHIPMENT_HEADERS

RCV_SHIPMENT_HEADERS stores common information about the source of your receipts or expected receipts. You group your receipts by the source type and the source of the receipt. Oracle Purchasing does not allow you to group receipts from different sources under one receipt header.

There are two receipt source types, Supplier and Internal Order, that you need to use when receiving against different source document types. You use a receipt source type of 'Supplier' when receiving items that you ordered from an external supplier using a purchase order. When you receive items that are part of an inter-organization transfer, or when receiving items that you request from your inventory using an internal requisition, the receipt type would be 'Internal Order'. The 'Internal Order' receipt source type populates the ORGANIZATION_ID column.

Oracle Purchasing creates a receipt header when you are entering your receipts or when you perform inter-organization transfers using Oracle Inventory. When Oracle Inventory creates a receipt header for an intransit shipment, the receipt number is not populated until you receive the shipment.

Database Triggers

Trigger Name : RCV_MRC_SHIPMENT_HEADERS_BIUD
 Trigger Time : BEFORE
 Trigger Level : ROW
 Trigger Event : INSERT, UPDATE, DELETE

This MRC trigger only exists when you install the Multiple Reporting Currencies feature. It is executed when you perform an insert, update, or delete statement on the table RCV_SHIPMENT_HEADERS. For each record being inserted/updated/deleted in RCV_SHIPMENT_HEADERS, this trigger inserts/updates/deletes corresponding reporting currency records in the MRC subtable, RCV_MC_SHIPMENT_HEADERS. In addition, this trigger also populates the MRC VARCHAR2 columns in RCV_SHIPMENT_HEADERS.

RCV_SHIPMENT_LINES

RCV_SHIPMENT_LINES stores information about items that have been shipped and/or received from a specific receipt source.

RCV_SHIPMENT_LINES also stores information about the default destination for intransit shipments.

RCV_TRANSACTIONS

RCV_TRANSACTIONS stores historical information about receiving transactions that you have performed. When you enter a receiving transaction and the receiving transaction processor processes your transaction, the transaction is recorded in this table.

Once a row has been inserted into this table, it will never be updated. When you correct a transaction, the net transaction quantity is maintained in RCV_SUPPLY. The original transaction quantity does not get updated. You can only delete rows from this table using the Purge feature of Oracle Purchasing.

Database Triggers

Trigger Name : RCV_MRC_TRANSACTIONS_BIUD
 Trigger Time : BEFORE
 Trigger Level : ROW
 Trigger Event : INSERT, UPDATE, DELETE

This MRC trigger only exists when you install the Multiple Reporting Currencies feature. It is executed when you perform an insert, update, or delete statement on the table RCV_TRANSACTIONS. For each record being inserted/updated/deleted in RCV_TRANSACTIONS, this trigger inserts/updates/deletes corresponding reporting currency records in the MRC subtable, RCV_MC_TRANSACTIONS. In addition, this trigger also populates the MRC VARCHAR2 columns in RCV_TRANSACTIONS.

Trigger Name : AX_RCV_TRANSACTIONS_AR11
 Trigger Time : AFTER
 Trigger Level : ROW
 Trigger Event : UPDATE

NEW.transaction_type IN ('CORRECT', 'RECEIVE', 'RETURN TO VENDOR') AND
 NEW.source_document_code != 'INVENTORY' AND NEW.destination_type_code != 'INVENTORY'
 AND NEW.destination_type_code != 'EXPENSE' This trigger captures accounting events information for the Global Accounting Engine when Oracle Inventory and the set of books used is defined as a subledger in the Global Accounting Engine application The information is used to create Global Accounting Engine accounting events. This trigger may populate the AX_EVENTS table.

This trigger captures accounting events related to Oracle Purchasing receiving transactions created by the transaction processor. It executes when the transaction type is 'RECEIVE', 'CORRECT', or 'RETURN TO VENDOR', and the source document code is not 'INVENTORY' and the destination type code is not 'EXPENSE' or 'INVENTORY'. Purpose: Capture accounting events related to a PO receiving transaction when it is created

RCV_TRANSACTIONS_INTERFACE

RCV_TRANSACTIONS_INTERFACE stores information about receiving transactions that are waiting to be processed by the receiving transaction processor or were rejected due to an error when the transaction processor attempted to process the transaction.

When the receiving transaction processor successfully processes a transaction, it deletes the transaction from this table.

WIP_COST_TXN_INTERFACE

WIP_COST_TXN_INTERFACE contains information about cost transactions that Oracle Work in Process needs to process. Each row represents either a resource transaction, an overhead transaction, an outside processing transaction, a cost update transaction, a period close variance transaction, or a job close variance transaction. Each row contains the transaction date, the job or repetitive schedule to charge, the resource to charge, the primary unit of measure transaction quantity, and the actual unit of measure transaction quantity. Each row also has foreign key references to move and receiving transaction tables. Oracle Work in Process uses this table to support all resource cost transactions including transactions loaded from other systems through the Oracle Work in Process Open Resource Transaction Interface.

WIP_DISCRETE_JOBS

WIP_DISCRETE_JOBS stores discrete job information. Each row represents a discrete job, and contains information about the assembly being built, the revision of the assembly, the job quantity, the status of the job, the material control method, accounting information, and job schedule dates. Oracle Work in Process uses this information to control discrete production.

Database Triggers

Trigger Name : WIP_DISCRETE_JOBS_T5
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : UPDATE

WIP_DISCRETE_JOBS_T5 calls PJM_PROJECT_LOCATOR.GET_JOB_PROJECTSUPPLY in order to update the locator for the project, if any, that is associated with the job being updated.

Oracle Proprietary, Confidential Information--Use Restricted by Contract

Trigger Name : WIP_DISCRETE_JOBS_BRU
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : UPDATE

WIP_DISCRETE_JOBS_BRU calls the procedure WIP_MRP_RELIEF.WIP_DISCRETE_JOBS_PROC if the status_type of the job is (or was) < 7 and the job is a standard discrete job. This procedure inserts rows into the table MRP_RELIEF_INTERFACE to do MPS relief.

Trigger Name : WIP_DISCRETE_JOBS_BRD
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : DELETE

WIP_DISCRETE_JOBS_BRD calls the procedure WIP_MRP_RELIEF.WIP_DISCRETE_JOBS_PROC if the status_type of the job was < 7 and the job is a standard discrete job. This procedure inserts rows into the table MRP_RELIEF_INTERFACE to do MPS relief.

Trigger Name : WIP_DISCRETE_JOBS_T4
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : INSERT

WIP_DISCRETE_JOBS_T4 calls PJM_PROJECT_LOCATOR.GET_JOB_PROJECTSUPPLY in order to find a locator for the project, if any, that is associated with the job being created.

WIP_ENTITIES

WIP_ENTITIES stores information about jobs, repetitive assemblies, and flow schedules. Each row includes a unique entity name, the entity type, and the assembly being built. Oracle Work in Process uses this information to control production activities and to ensure that entities with duplicate names are not created.

WIP_FLOW_SCHEDULES

WIP_FLOW_SCHEDULES stores Work Order-less Flow schedule information. Each row represents a Flow schedule and contains information about the assembly being built, the assembly revision, the schedule quantity, the status of the Flow schedule, and accounting information. Oracle Work in Process uses this information to control Flow schedule production.

WIP_FLOW_SCHEDULES_BRI inserts a corresponding row in WIP_ENTITIES.

Trigger Name : WIP_FLOW_SCHEDULES_ARD
 Trigger Time : AFTER
 Trigger Level : ROW
 Trigger Event : DELETE

WIP_FLOW_SCHEDULES_ARD deletes a corresponding row in WIP_ENTITIES.

WIP_LINES

WIP_LINES stores production line information. Each row includes a line name, maximum and minimum rate information, throughput for rate based lines (lead time), and the start and stop time information that determines the amount of time per day that the line is available. Oracle Work in Process uses this information when you associate a line with a repetitive assembly and when you define a repetitive schedule on the line. Production line information is optional for discrete jobs.

WIP_MOVE_TRANSACTIONS

WIP_MOVE_TRANSACTIONS stores information about shop floor Move transactions. Each row represents a single Move transaction and includes a unique transaction identifier, the transaction date, the job or repetitive schedule in which the Move occurs, the Move quantity, as well as information about the From and To operation sequence numbers, operation codes, and intraoperation steps. Oracle Work in Process uses this information to track Move transactions.

WIP_MOVE_TXN_INTERFACE

WIP_MOVE_TXN_INTERFACE contains information about the shop floor Move transactions that need to be processed. Each row contains the transaction date, the job or repetitive schedule in which you are moving assemblies, the primary unit of measure, the actual unit of measure transaction quantities, the foreign keys necessary for WIP to process the Move transaction as well as information about the From and To operation sequence numbers, operation codes, and intraoperation steps. This table supports all shop floor Move transactions including transactions loaded from other systems, such as bar code readers, using the Oracle Work in Process Open Move Transaction Interface.

WIP_OPERATIONS

WIP_OPERATIONS stores information about job and repetitive schedule operations. Each row represents a specific operation and includes an operation sequence number, which orders the operations for the job or repetitive schedule. Each row also includes the assembly quantity completed at an operation, the quantity at each intraoperation step, the department associated with an operation, the scheduled start and completion dates for an operation, the operation's countpoint and backflush types and other operation attributes. In general, Oracle Work in Process uses this information to control and monitor assembly production on the shop floor.

WIP_OPERATION_RESOURCES stores information about the resource requirements associated with job and repetitive schedule operations. Each row represents a resource requirement and contains a sequence number, the resource's unit of measure, its usage rate or amount, and several other attributes that control how it is scheduled and costed. Oracle Work in Process uses this information to schedule jobs and repetitive schedules and to charge resources to jobs and schedules.

WIP_PERIOD_BALANCES

WIP_PERIOD_BALANCES stores summary accounting information for jobs and schedules. Each row represents job or schedule charges within a given accounting period, and contains the summary values for each cost element. Oracle Work in Process uses this information to report job and schedule values and to calculate job and period variances.

WIP_REPETITIVE_ITEMS

WIP_REPETITIVE_ITEMS stores information about repetitive assemblies and the production lines on which they are built. Each row represents a particular assembly and line combination, and includes information such as the line priority, the accounting class associated with the line, the production rate, the supply type of the line, whether the line is used in calculating the assembly's lead time (PRIMARY_LINE_FLAG), the completion subinventory and locator for a line, and the alternate bill and/or routing used for a particular line. Oracle Work in Process uses this information when you define repetitive schedules. Oracle Master Scheduling/MRP and Oracle Supply Chain Planning, as well as Oracle Capacity, use this information when mass loading repetitive schedules and running capacity loads on repetitive schedules.

WIP_REPETITIVE_SCHEDULES

WIP_REPETITIVE_SCHEDULES stores repetitive schedule information. Each row includes a repetitive schedule Identifier, information about the schedule's production line, start and end dates, rate, throughput, revision, status, and information on the General Ledger accounts to which charges for this schedule are written. Oracle Work in Process uses this information to control repetitive production.

WIP_SHOP_FLOOR_STATUSES

WIP_SHOP_FLOOR_STATUSES stores the status codes that you assign to a discrete job or repetitive schedule. Each row contains the operation sequence number and intraoperation step to which you assign the status. Oracle Work in Process uses this information to determine which operations and intraoperation steps you assigned statuses to in a job or repetitive schedule.

WIP_SHOP_FLOOR_STATUS_CODES

WIP_SHOP_FLOOR_STATUS_CODES stores the status codes and descriptions defined in the Shop Floor Statuses window in Oracle Work in Process. Each row contains information such as the status name, description, and whether the status prevents you from moving assemblies out of an operation and interoperation step to which you assign the status.

WIP_TRANSACTIONS

WIP_TRANSACTIONS stores information about WIP resource transactions. Each row represents a single resource transaction and includes a unique transaction Identifier, a transaction date, the job or repetitive schedule charged, the WIP operation and resource charges, and the number of units of measure applied. Oracle Work in Process uses this information to track resource charges and to calculate the values stored in WIP_TRANSACTION_ACCOUNTS.

Database Triggers

Trigger Name : AX_WIP_TRANSACTIONS_ARI1
Trigger Time : AFTER
Trigger Level : ROW
Trigger Event : INSERT

This trigger captures information needed to create subledger accounting events when Oracle Inventory and the set of books used is defined as a subledger in the Global Accounting Engine application. This trigger captures accounting events related to WIP resource transactions. It executes when an outside resource transaction is created and the source is from a receiving system. It populates the AX_EVENTS table.

WIP_TRANSACTION_ACCOUNTS

WIP_TRANSACTION_ACCOUNTS stores the accounting information for each resource transaction in WIP_TRANSACTIONS. These two tables are joined by the column TRANSACTION_ID, and contain at least two account rows for every resource transaction (unless the resource is uncosted). Each row represents a debit or a credit accounting entry, and the sum of all rows for a given transaction Identifier should be zero. Each row includes the account, transaction date, transaction value, purpose (ACCOUNTING_LINE_TYPE), and the source of the charges (the job or repetitive schedule). The TRANSACTION_VALUE and BASE_TRANSACTION_VALUE are transferred to the GL_INTERFACE table through the period close or GL transfer (INTCGL) process. Until this process is run, the GL_BATCH_ID is set to -1. Oracle Work in Process uses the information in this table to track the financial impact of resource transactions.

WMS_STRATEGIES_B

WMS_STRATEGIES_B stores WMS strategies. A strategy is consist of rules. The order of the rules in the strategy is important as it defines the sequence of execution for the rules.

Oracle Bills of Material Technical Reference Manual A90197-01

Oracle Corporation welcomes your comments and suggestions on the quality and usefulness of this publication. Your input is an important part of the information we use for revision.

- Did you find any errors?
- Is the information clearly presented?
- Do you need more information? If so, where?
- Are the examples correct? Do you need more examples?
- What features did you like most about this manual? What did you like least about it?

If you find any errors or have any other suggestions for improvement, please indicate the topic, chapter, and page number below:

Please send your comments to:
