Introduction

The *Oracle Depot Repair Technical Reference Manual* provides the information you need to understand the underlying structure of Oracle Depot Repair. After reading this manual, you should be able to convert your existing applications data, integrate your existing applications with Oracle Depot Repair, and write custom reports for Oracle Depot Repair, as well as read data that you need to perform other tasks.

This chapter introduces you to the *Oracle Depot Repair Technical Reference Manual*, and explains how to use it.

Introduction

At Oracle, we design and build applications using Oracle Designer, our systems design technology that provides a complete environment to support developers through all stages of a systems life cycle. Because we use a repository-based design toolset, all the information regarding the underlying structure and processing of our applications is available to us online. Using Oracle Designer, we can present this information to you in the form of a technical reference manual.

This *Oracle Depot Repair Technical Reference Manual* contains detailed, up-to-date information about the underlying structure of Oracle Depot Repair. As we design and build new releases of Oracle Depot Repair, we update our Oracle Designer repository to reflect our enhancements. As a result, we can always provide you with an *Oracle Depot Repair Technical Reference Manual* that contains the latest technical information as of the publication date. Note that after the publication date we may have added new indexes to Oracle Depot Repair to improve performance.

About this Manual

This manual describes the Oracle Customer Relationship Management (CRM) Applications Release 11i data model, as used by Oracle Depot Repair; it discusses the database we include with a fresh install of Oracle CRM Release 11i. If you have not yet upgraded to Release 11i, your database may differ from the database we document in this book.

You can contact your Oracle representative to confirm that you have the latest technical information for Oracle Depot Repair. You can also use *OracleMetaLink* which is accessible through Oracle's Support Web Center (http://www.oracle.com/support/elec_sup).

Finding the Latest Information

The *Oracle Depot Repair Technical Reference Manual* contains the latest information as of the publication date. For the latest information we encourage you to use *OracleMetaLink* which is accessible through Oracle's Support Web Center (http://www.oracle.com/support/elec_sup).

Audience

The *Oracle Depot Repair Technical Reference Manual* provides useful guidance and assistance to:

- Technical End Users
- Consultants
- Systems Analysts
- System Administrators
- Other MIS professionals

This manual assumes that you have a basic understanding of structured analysis and design, and of relational databases. It also assumes that you are familiar with Oracle Application Object Library and Oracle Depot Repair. If you are not familiar with the above products, we suggest that you attend one or more of the training classes available through Oracle Education (see: Other Information Sources: page 1 – 7).

How This Manual is Organized

This manual contains two major sections, High–Level Design and Detailed Design.

High–Level Design

This section, Chapter 2, contains database diagrams and lists each database table and view that Oracle Depot Repair uses. This chapter also has a list of modules.

Detailed Design

This section, Chapter 3, contains a detailed description of the Oracle Depot Repair database design, including information about each database table and view you might need for your custom reporting or other data requirements.

How to Use This Manual

The *Oracle Depot Repair Technical Reference Manual* is a single, centralized source for all the information you need to know about the underlying structure and processing of Oracle Depot Repair. For example, you can use this manual when you need to:

- Convert existing application data
- Integrate your Oracle Depot Repair application with your other applications systems
- Write custom reports
- Define alerts against Oracle Applications tables
- Configure your Oracle Self-Service Web Applications
- Create views for decision support queries using query tools
- Create business views for Oracle Discoverer

You need not read this manual cover to cover. Use the table of contents and index to quickly locate the information you need.

How Not To Use This Manual

Do not use this manual to plan modifications

You should not use this manual to plan modifications to Oracle Depot Repair. Modifying Oracle Depot Repair limits your ability to upgrade to future releases of your Oracle Depot Repair application. In addition, it interferes with our ability to give you the high-quality support you deserve.

We have constructed Oracle Depot Repair so that you can customize it to fit your needs without programming, and you can integrate it with your existing applications through interface tables. However, should you require program modifications, you should contact our support team (see: Other Information Sources: page 1 – 7). They can put you in touch with Oracle Services, the professional consulting organization of Oracle. Their team of experienced applications professionals can make the modifications you need while ensuring upward compatibility with future product releases.

Do not write data into non-interface tables

Oracle reserves the right to change the structure of Oracle Applications tables, and to change the meaning of, add, or delete lookup codes and data in future releases. Do not write data directly into or change data in non-interface tables using SQL*Plus or other programming tools because you risk corrupting your database and interfering with our ability to support you.

Moreover, this version of the *Oracle Depot Repair Technical Reference Manual* does not contain complete information about the dependencies between Oracle Depot Repair applications tables. Therefore, you should write data into only those tables we identify as interface tables. If you write data into other non-interface tables, you risk violating your data integrity since you might not fulfill all the data dependencies in your Oracle Depot Repair application.

You are responsible for the support and upgrade of the logic within the procedures that you write, which may be affected by changes between releases of Oracle Applications.

Do not rely on upward compatibility of the data model

Oracle reserves the right to change the structure of Oracle Depot Repair tables, and to change the meaning of, add, or delete lookup codes and other data in future releases. We do not guarantee the upward compatibility of the Oracle Depot Repair data model. For example, if you write a report that identifies concurrent requests that end in Error status by selecting directly from Oracle Application Object Library tables, we do not guarantee that your report will work properly after an upgrade.

About Oracle Application Object Library

The *Oracle Depot Repair Technical Reference Manual* may contain references to tables that belong to Oracle Application Object Library. Oracle Application Object Library is a collection of pre-built application components and facilities for building Oracle Applications and extensions to Oracle Applications. Oracle Application Coding Standards use the Oracle Application Object Library and contains shared components including but not limited to — forms, subroutines, concurrent programs and reports, database tables and objects, messages, menus, responsibilities, flexfield definitions and online help.

Attention: Oracle does not support *any* customization of Oracle Application Object Library tables or modules, not even by Oracle consultants. (Oracle Application Object Library tables generally have names beginning with FND_%.)

Accordingly, this manual does not contain detailed information about most Oracle Application Object Library tables used by Oracle Depot Repair.

A Few Words About Terminology

The following list provides you with definitions for terms that we use throughout this manual:

Relationship

A relationship describes any significant way in which two tables may be associated. For example, rows in the Journal Headers table may have a one-to-many relationship with rows in the Journal Lines table.

Database Diagram

A database diagram is a graphic representation of application tables and the relationships between them.

Module

A module is a program or procedure that implements one or more business functions, or parts of a business function, within an application. Modules include forms, concurrent programs and reports, and subroutines.

Application Building Block

An application building block is a set of tables and modules (forms, reports, and concurrent programs) that implement closely-related database objects and their associated processing. Said another way, an application building block is a logical unit of an application.

QuickCodes

QuickCodes let you define general purpose, static lists of values for window fields. QuickCodes allow you to base your program logic on lookup codes while displaying user-friendly names in a list of values

Oracle Proprietary, Confidential Information—Use Restricted by Contract

window. QuickCodes simplify name and language changes by letting you change the names your end users see, while the codes in your underlying programs remain the same.

Form

A form is a module comprised of closely related windows that are used together to perform a task. For example, the Enter Journals form in Oracle General Ledger includes the Enter Journals window, the Batch window, and the More Actions window among others. The Enter Journals window is the main window, and from it, you can use buttons to navigate to other windows in the form. The form name usually corresponds to the main window in the form, and is frequently a window you open directly from the Navigator.

Training

Oracle Education offers a complete set of training courses to help you and your staff master Oracle CRM Applications. We can help you develop a training plan that provides thorough training for both your project team and your end users. We will work with you to organize courses appropriate to your job or area of responsibility.

Training professionals can show you how to plan your training throughout the implementation process so that the right amount of information is delivered to key people when they need it the most. You can attend courses at any one of our many Educational Centers, or you can arrange for our trainers to teach at your facility. In addition, we can tailor standard courses or develop custom courses to meet your needs.

Support

From on-site support to central support, our team of experienced professionals provides the help and information you need to keep Oracle Depot Repair working for you. This team includes your Technical Representative, Account Manager, and Oracle's large staff of consultants and support specialists with expertise in your business

area, managing an Oracle server, and your hardware and software environment.

About Oracle

Oracle Corporation develops and markets an integrated line of software products for database management, applications development, decision support, and office automation, as well as Oracle Applications, an integrated suite of more than 75 software modules for financial management, supply chain management, manufacturing, project systems, human resources, and sales and service management.

Oracle products are available for mainframes, minicomputers, personal computers, network computers, and personal digital assistants, allowing organizations to integrate different computers, different operating systems, different networks, and even different database management systems, into a single, unified computing and information resource.

Oracle is the world's leading supplier of software for information management, and the world's second largest software company. Oracle offers its database, tools, and applications products, along with related consulting, education, and support services, in over 145 countries around the world.

Thank You

Thanks for using Oracle Depot Repair and this technical reference manual!

We appreciate your comments and feedback. After the Table of Contents of this manual is a Reader's Comment Form that you can use to explain what you like or dislike about Oracle Depot Repair or this technical reference manual. High-Level Design

This chapter presents a high-level design for Oracle Depot Repair that satisfies the business needs we specify during Strategy and Analysis. It contains database diagrams for Oracle Depot Repair application building blocks, lists of database tables and views, and a list of modules.

Overview of High-Level Design

During High-Level Design, we define the application components (tables, views, and modules) we need to build our application. We specify what application components should do without specifying the details of *how* they should do it.

You can refer to this High-Level Design chapter to quickly acquaint yourself with the tables, views, and modules that comprise Oracle Depot Repair applications. And, you can prepare yourself to understand the detailed design and implementation of Oracle Depot Repair.

Summary Database Diagram

The Summary Database Diagram section graphically represents the most important application tables and the relationships between them. It omits tables and relationships that contribute little to the understanding of the application data model. Typically, a summary database diagram shows tables that contain key reference and transaction data.

We prepare a summary database diagram to describe, at a conceptual level, the key information on which our business depends. Later, we refine this summary database diagram, breaking it into multiple database diagrams (generally, one per application building block) to represent all the tables and relationships we need to implement our application in the database.

Review the Summary Database Diagram section to see at a glance the major tables and relationships on which your Oracle Depot Repair application depends.

Database Diagrams

The Database Diagrams section graphically represents all Oracle Depot Repair applications tables and the relationships between them, organized by building block.

Use this section to quickly learn what tables each Oracle Depot Repair application building block uses, and how those tables interrelate. Then, you can refer to the Table and View Definitions sections of Chapter 3 for more detailed information about each of those tables.

Oracle Proprietary, Confidential Information—Use Restricted by Contract

Table Lists

The Table List sections list the Oracle Depot Repair applications tables. Because a product might not include at least one table for each type, this Technical Reference Manual might not include each of the following sections.

Public Tables

Use the Public Table List section to quickly identify the tables you are most interested in. Then, you can refer to the Table and View Definitions sections of Chapter 3 for more detailed information about those tables.

In addition, this manual may contain full documentation for one or more of the following Application Object Library tables: FND_DUAL, FND_CURRENCIES, and FND_COMMON_LOOKUPS.

Internal Tables

This section includes a list of private, internal tables used by Oracle Depot Repair; we do not provide additional documentation for these tables.

View Lists

The View List sections list the Oracle Depot Repair views, with one section for each type of view. Because a product might not include at least one view for each type, this Technical Reference Manual might not include each of the following sections.

Use this section to quickly identify the views you are most interested in. Then, you can refer to the Table and View Definitions sections of Chapter 3 for more detailed information about those views.

Public Views

This section lists views that may be useful for your custom reporting or other data requirements. The list includes a description of the view, and the page in Chapter 3 that gives detailed information about the public view.

Web Views

This section lists views that you may need to configure your Self-Service Web applications. The list includes a description of the view, and the page in Chapter 3 that gives detailed information about the web view.

Forms and Table Views

This section lists supplementary views that are not essential to the Release 11i data model, but simplify coding or improve performance for Oracle Developer.

Internal Views

This section includes each private, internal view that Oracle Depot Repair uses.

Single-Organization Views

This section lists the Oracle Depot Repair views that we added to take the place of various tables that are now partitioned by operating unit, to support multiple sets of books within a single installation of Oracle Depot Repair.

Multiple Reporting Currency Views

This list includes views that were created to support the Multiple Reporting Currencies feature.

MultiLingual Views

This section lists views that were created to allow certain seed data to be available in multiple national languages simultaneously.

Module List

The Module List section briefly describes each of the Oracle Depot Repair applications modules. This section lists forms, reports, and concurrent programs.

A form is a module comprised of closely related windows that are used together to perform a task. For example, the Enter Journals form in Oracle General Ledger includes the Enter Journals window, the Batch

Oracle Proprietary, Confidential Information—Use Restricted by Contract

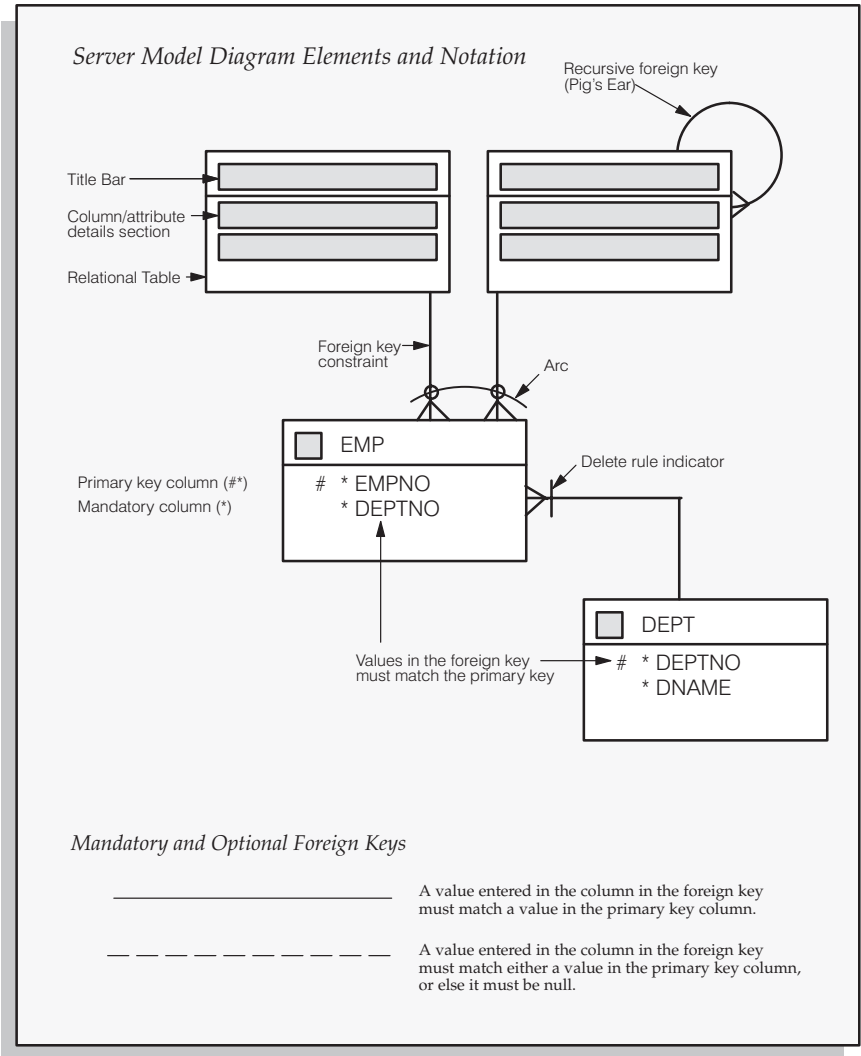

window, and the More Actions window. The Enter Journals window is the main window, and from it, you can use buttons to navigate to other windows in the form. The form name usually corresponds to the main window in the form, and is frequently a window you can open directly from the Navigator.

The Reports and Concurrent Programs lists include processes you can submit from the Submit Requests window or other windows, as well as processes that are submitted automatically by Oracle Depot Repair. Use your user's guide to learn more about reports and concurrent processes.

Database Diagramming Conventions

Figure 2 – 1
Database Diagram
Conventions

We use the following notational conventions in our database diagrams:

Tables – are the basic unit of storage in the database. A hand symbol preceding the title in the table's title bar indicates that the table is not owned by this application but shared with another.

Foreign key constraint – is a type of referential integrity constraint for checking the integrity of data entered in a specific column or set of columns. This specified column or set of columns is known as the foreign key.

Delete rule indicator – determines the action to be taken when an attempt is made to delete a related row in a join table. A line through the foreign key constraint, as shown on the above diagram, indicates that this action is restricted.

Arcs – specify that, for any given row in a table, a value must be entered in one of the arc columns. The remaining columns within the arc must be null.

Oracle Depot Repair Summary Database Diagram

Database Diagrams

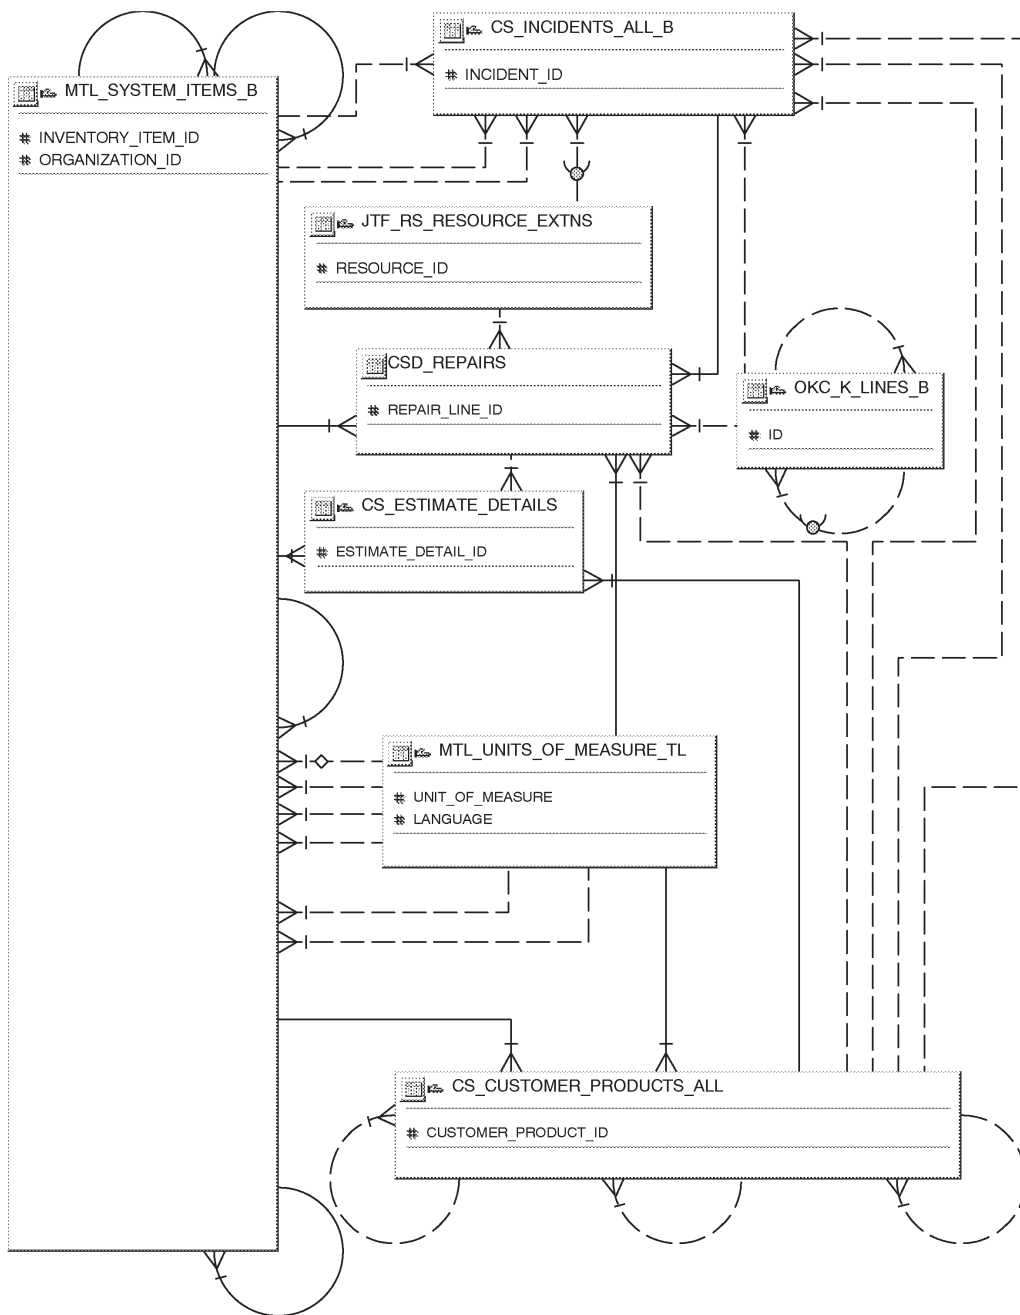

This section graphically represents most of the significant Oracle Depot Repair tables and the relationships between them, organized by building block. Use this section to quickly learn what tables each Oracle Depot Repair application building block uses, and how these tables interrelate. Then, you can refer to the Table and View Definitions sections of Chapter 3 for more detailed information about each of those tables.

This section contains a database diagram for each of the following Oracle Depot Repair application building blocks:

- Diagram 1: Repair Orders
- Diagram 2: Repair Jobs and History

Some tables, especially important reference tables, appear in more than one database diagram. When several building blocks use a table, we show that table in each appropriate database diagram.

Repair Orders

Repair Jobs and History

Public Table List

This section lists each public database table that Depot Repair uses and provides a brief description of each of those tables. The page reference is to the table description in Chapter 3.

Note that “public” tables are not necessarily intended for write access by custom code; Oracle Corporation supports write access using only standard Oracle Applications forms, reports, and programs, or any SQL write access to tables explicitly documented as API tables. For more information, see the How Not To Use This Manual section of this book’s Introduction.

Depot Repair uses the following Public tables:

Table Name	Description
CSD_REPAIRS	This table holds all the repair orders. (See page 3 – 9)
CSD_REPAIR_HISTORY	This table stores all the events (e.g. Broken Product Received, Job Created, Product Shipped) associated with a repair order. (See page 3 – 16)
CSD_REPAIR_JOB_XREF	This table holds all the jobs submitted for a repair order. (See page 3 – 22)
CSD_REPAIR_TYPES_B	This table stores all the repair types. (See page 3 – 27)
CSD_REPAIR_TYPES_TL	This is the translation table for the repair type table CSD_REPAIR_TYPES_B. (See page 3 – 29)
CS_CP_REVISIONS	Revision information about products in the installed base (See page 3 – 32)
CS_CUSTOMER_PRODUCTS_ALL	The installed base Products information. (See page 3 – 34)
CS_CUSTOMER_PRODUCT_STATUSES	Statuses that can be assigned to products in the installed base (See page 3 – 38)
CS_ESTIMATE_DETAILS	Items Required for service Billing (See page 3 – 40)
CS_INCIDENTS_ALL_B	This table stores non-translated information about service requests. (See page 3 – 47)
FND_LANGUAGES	National dialects (See page NO TAG)
FND_LOOKUP_VALUES	QuickCode values (See page NO TAG)

JTF_RS_RESOURCE_EXTNS	This is table stores all important information about Resources. These Resources are coming from HR or HZ or Vonder table etc. Primary key is resource_id. Resource_number, user_id sre also unique keys. (See page 3 – 61)
MTL_SYSTEM_ITEMS_B	Inventory item definitions (See page 3 – 64)
MTL_UNITS_OF_MEASURE_TL	Unit of measure definitions (See page 3 – 83)
OKC_K_LINES_B	Deliverable ITEMS grouped into a logical set usually defined by unitary price, delivery or some other classification. (See page 3 – 85)
WF_ITEM_TYPES	Item type definition (See page 3 – 88)
WIP_DISCRETE_JOBS	Discrete jobs (See page 3 – 89)
WIP_ENTITIES	Information common to jobs and schedules (See page 3 – 95)

Public View List

This section lists each public database view that Oracle Depot Repair uses and provides a brief description of each of those views. These views may be useful for your custom reporting or other data requirements. The page reference is to the detailed view description in Chapter 3.

Oracle Depot Repair uses the following public views:

View Name	Description
ASO_I_ITEM_UOMS_V	This is a view on MTL_ITEMS_UOMS_VIEW which gets valid UOMs for items, considering the conversions that are defined (See page 3 – 8)
CSD_REPAIRS_V	The view for getting repair orders. (See page 3 – 12)
CSD_REPAIR_HISTORY_V	The view for getting repair order history. (See page 3 – 19)
CSD_REPAIR_JOB_XREF_V	The view for getting repair order jobs. (See page 3 – 24)
CSD_REPAIR_TYPES_VL	This is the VL view of the Repair Types. (See page 3 – 30)
CS_INCIDENTS_V	Service requests and their attributes. This view is used by the main service request form. (See page 3 – 52)
FND_LOOKUPS	Oracle Application Object Library QuickCodes (See page 3 – 60)
MFG_LOOKUPS	(See page NO TAG)
MTL_SYSTEM_ITEMS_VL	System Items multilingual view with concatenated segments column (See page NO TAG)
MTL_UNITS_OF_MEASURE_VL	(See page NO TAG)

Forms and Table View List

This section lists supplementary views that are not essential to the Release 11i data model, but simplify coding or improve performance of Developer. For example, many of these views are used as base tables in Oracle Depot Repair forms.

Warning: We do not recommend you query or alter data using these views. Furthermore, these views may change dramatically in subsequent minor or major releases of Oracle Depot Repair.

Oracle Depot Repair uses the following Forms and Table views:

- CSD_CP_REFERENCE_V
- CSD_INCIDENTS_V
- CSD_REPAIR_JOBS_V

Multilingual View List

This section lists each MultiLingual database view that Oracle Depot Repair uses. MultiLingual views were created to allow certain seed data to be available in multiple national languages simultaneously.

Oracle Depot Repair uses the following Multilingual views:

- WF_ITEM_TYPES_VL

Module List

This section lists each form, report and concurrent program comprising Depot Repair.

Forms

CSDCRJOB	Submitting Repair Jobs
CSDREPLN	Repair Orders Maintenance
CSDRTSET	Repair Types Maintenance

Detailed Design

This chapter presents a detailed design for implementing Oracle Depot Repair. It contains detailed definitions of tables and views that you may need to reference to write custom reports or use for other data extraction.

Overview of Detailed Design

During Detailed Design, we specify in detail how each applications component should work. We prepare detailed definitions of tables and views.

You can refer to this Detailed Design chapter to gain a detailed understanding of the underlying structure and processing of Oracle Depot Repair that enables you to:

- Convert existing application data
- Integrate your Oracle Depot Repair application with your other applications systems
- Write custom reports
- Define alerts against Oracle Applications tables
- Create views for decision support queries using query tools
- Configure your Oracle Self-Service Web Applications

Table and View Definitions

The Table and View Definitions section contains a detailed definition of Oracle Depot Repair applications tables. For each table, it provides information about primary keys, foreign keys, QuickCodes, indexes, triggers, and sequences. It also gives you a detailed description of each column and its characteristics. In addition, it provides the SQL statement that defines each view. Review this section to get a detailed understanding of what tables your Oracle Depot Repair application contains, and how it uses them to hold and access the information it needs.

Table and View Definitions

This section contains a detailed description of each Oracle Depot Repair table and view that you may need to reference. For each table, it presents detailed information about:

- Primary keys
- Foreign keys
- Column descriptions
- Indexes
- Oracle sequences
- Triggers
- View derivations

Because Oracle does not support customization of Oracle Application Object Library tables, we do not provide you with detailed information about them. Consequently, this section does not document all the FND_% tables Oracle Depot Repair uses.

The following sections appear in each table or view description:

Foreign Keys

To help you understand the relationships between tables, we list each foreign key contained in a table. For each foreign key in a table, we list the primary key table name (the table to which a foreign key refers), its corresponding primary key columns, and the foreign key columns that refer to those primary key columns.

When the primary key table has a composite primary key, we list each column of the composite key sequentially.

If a table contains two or more distinct foreign keys that refer to the same primary key table, we repeat the primary key table name and list each of the distinct foreign keys separately.

QuickCodes Columns

When a database column contains a QuickCodes value, which we implement using a foreign key to FND_LOOKUPS, MFG_LOOKUPS, or to some other lookup table, we list the QuickCodes type (lookup

Oracle Proprietary, Confidential Information—Use Restricted by Contract

type) to which the QuickCodes value must belong and a complete list of QuickCodes values and meanings. Some QuickCodes can be defined by you in the application. These values are designated as User-defined.

Column Descriptions

We list the important characteristics of each column in a table or view. These characteristics include whether the column is part of the table's primary key, whether Oracle8i requires a value for this column, and the data type of the column. We also give you a brief description of how Oracle Depot Repair uses the column.

When a column is part of a table's primary key, we append the notation (PK) to the name of that column.

To help you understand which columns Oracle Depot Repair uses and which columns it does not use, we alert you to any unused column. When no module uses a database column, we show one of the following legends in the Description column:

Not currently used	Oracle Depot Repair does not use this column, although the column might be used in a future release.
No longer used	Oracle Depot Repair no longer uses this column. AutoInstall installs this column. Subsequent versions of Oracle Depot Repair might not include this column.
No longer installed	Oracle Depot Repair no longer uses this column. If you <i>upgraded</i> your software from an earlier version, you may still have this column, depending upon whether you chose to delete it during an upgrade process. If you <i>install</i> Oracle Depot Repair, you do not have this column.

Standard Who Columns

Most Oracle Depot Repair tables contain standard columns to support \ Row Who. When your program or SQL*Plus command selects a row from a table, use these columns to determine who last updated the row. If your program or SQL*Plus command updates or inserts a row in an

interface table, you must populate each of the five standard Who columns:

LAST_UPDATE_DATE	Date when a user last updated this row
LAST_UPDATED_BY	User who last updated this row (foreign key to FND_USER.USER_ID)
CREATION_DATE	Date when this row was created
CREATED_BY	User who created this row (foreign key to FND_USER.USER_ID)
LAST_UPDATE_LOGIN	Operating system login of user who last updated this row (foreign key to FND_LOGINS.LOGIN_ID). You should set this to NULL, or to 0 if NULL is not allowed

Since every table containing Who columns has several foreign keys to the tables FND_USER and FND_LOGINS, we do not include the foreign key columns LAST_UPDATED_BY, CREATED_BY, or LAST_UPDATE_LOGIN in a table's list of foreign keys.

Additional Who Columns for Concurrent Programs

Some Oracle Depot Repair tables also contain several additional Who columns to distinguish between changes a user makes with a form and changes a concurrent program makes. When a concurrent program updates or inserts a row in a table, the concurrent program populates the following additional Who columns:

REQUEST_ID	Concurrent request ID of program that last updated this row (foreign key to FND_CONCURRENT_REQUESTS.REQUEST_ID)
PROGRAM_APPLICATION_ID	Application ID of program that last updated this row (foreign key to FND_APPLICATION.APPLICATION_ID)
PROGRAM_ID	Program ID of program that last updated this row (foreign key to FND_CONCURRENT_PROGRAM.CONCURRENT_PROGRAM_ID)
PROGRAM_UPDATE_DATE	Date when a program last updated this row

Since every table containing these additional Who columns has several foreign keys to the tables FND_CONCURRENT_REQUESTS, FND_APPLICATION, and FND_CONCURRENT_PROGRAM, we do not include the foreign key columns REQUEST_ID, PROGRAM_APPLICATION_ID, or PROGRAM_ID in a table's list of foreign keys.

Columns Reserved for Country-Specific Localizations

Some tables have GLOBAL_ATTRIBUTE columns which support additional features added to Oracle Depot Repair to meet statutory requirements and common business practices in your country or region. For details on these columns, refer to the Appendix in *Oracle Financials Regional Technical Reference Manual*. To read more about the features that these columns support, look for a User Guide appropriate to your country; for example, see the *Oracle Financials for the Czech Republic User Guide*.

Indexes

If an Oracle Depot Repair table uses an Oracle8i index, we list the database columns that comprise that index, in sequential order.

Note: The indexes we document in this manual correspond to unique keys we specified during product development and testing. In some cases, we may add additional indexes during the porting process to fine-tune performance on specific platforms; therefore, there may be minor differences between the indexes documented in this book and the indexes for production versions of Oracle Depot Repair.

Sequences

Oracle Depot Repair uses Oracle8i sequence generators to generate unique integers. If any table column gets its value from an Oracle8i sequence generator, we list the name of the corresponding sequence generator and the name of the column that stores the unique integer.

Database Triggers

If a table has one or more active database triggers, we provide a brief explanation of each database trigger and when it fires.

View Derivation

For each Oracle Depot Repair view you may need to reference, we include important elements from the SQL statement that defines or creates a view. By studying this view definition, you can understand exactly how a view derives its contents.

ASO_I_ITEM_UOMS_V

This is a view with all the columns selected from MTL_ITEMS_UOMS_VIEW which gets valid UOMs for items, considering the conversions that are defined MTL_ITEM_UOMS_VIEW is used to show all the valid uom based on the allowed uom type (ie, item specific, standard, item specific and standard) of an item. This view can be used to replace the UOM quick pick logic in the transaction forms.

CSD_REPAIRS

This table holds all the repair orders. Now in 11i, Service Request is mandatory to create a repair order. CSD_REPAIRS is not stripped by ORG_ID as the parent CS_INCIDENTS_ALL_B is already stripped by ORG_ID. CUSTOMER_PRODUCT_ID identifies the customer product in the installed base, if the installed base has information about the item when it was originally shipped out to the customer. This information can be used during the estimation process to take into account any special services which the customer may have purchased.

CSD_REPAIR_HISTORY

This table stores all the events (e.g. Broken Product Received, Job Created, Product Shipped) associated with a repair order. This table has 10 number, 10 character, 10 date parameters. Parameters hold the necessary information about the event e.g. for Job Created event one number parameter holds the inventory organization id.

CS_CP_REVISIONS

CS_CP_REVISIONS stores information about revisions of products in the installed base that have shipped on sales orders in Oracle Order Entry/Shipping. Each product has at least one revision record associated with it in CS_CP_REVISIONS.

Until the time a revision is shipped (if shippable), SHIPPED_FLAG is set to "N". If "Pick Release" is an action in the order cycle for the originating order in Order Entry/Shipping, then DELIVERED_FLAG is also set to "N"; otherwise it is set to "Y".

When a revision ships, both SHIPPED_FLAG as well as DELIVERED_FLAG are set to "Y".

COMPONENT_FROZEN_FLAG applies to revisions whose configuration contains non-shippable included items. It indicates whether a configuration's included items, if any, have been frozen in Order Entry/Shipping.

The primary key for this table is CP_REVISION_ID.

CS_CUSTOMER_PRODUCTS_ALL

CS_CUSTOMER_PRODUCTS_ALL stores information about products that customers own. Each row holds information about a single customer product. Sales order information is brought over by interface programs and stored in this table as customer product records.

PARENT_CP_ID points to the earliest grandparent in a set of related products (upgrades, replacements, etc.). For example, if product A was upgraded to product B which was then upgraded to product C, there would be three records in this table, all of which have PARENT_CP_ID pointing to product A.

ORIGINAL_ORDER_LINE_ID holds the link from this record to the original order. Prior to this release, some of the order information used to be stored in this table. However, we have now normalized the information by removing all the order data from this table. All the order information can now be obtained from the corresponding "order management" system. The ORIGINAL_ORDER_LINE_ID field has hence become a mandatory field.

RMA_LINE_ID and RETURN_BY_DATE are set for some related products (replacements, loaners, etc.) based on the charge details specified in Depot Repair for such transactions. ACTUAL_RETURNED_DATE is set when the product is actually returned.

CONFIG_ENABLED_FLAG, CONFIG_START_DATE,CONFIG_END_DATE, CONFIG_ROOT_ID,CONFIG_PARENT_ID, and CONFIG_TYPE are columns for the configuration management functionality. CONFIG_ENABLED_FLAG is set to 'Y' when a particular customer product is configuration management enabled. A customer product can be of one of the five pre-defined types: AS_ORDERED,AS_BUILT,AS_SHIPPED, AS_INSTALLED, and AS_MAINTAINED, or user defined types.

ORG_ID partitions data in this table by organization in a multi-organization environment.

The primary key for this table is CUSTOMER_PRODUCT_ID.

CS_ESTIMATE_DETAILS

CS_ESTIMATE_DETAILS stores billing information about a Depot repair/service request/Debrief record once the repair has been received, the service request has been created or Field Service Report(FSR) has been created. For each record in CSD_REPAIRS_ALL,CS_INCIDENTS_B_ALL, CSF_DEBRIEF_LINES CS_ESTIMATE_DETAILS holds multiple records. INCIDENT_ID specifies the service request that was created for repair or FSR CONTRACT_ID specifies the contract which the customer may have purchased, to be used while estimating the repair charges. BUSINESS_PROCESS_ID associates the charge with a business process. LINE_TYPE_ID and PRICE_LIST_ID are associated with the Oracle Order Entry/Shipping information for Line_Type and price list respectively. The bill-to and ship-to information is stored in INVOICE_TO_SITE_USE_ID and SHIP_TO_SITE_USE_ID.

TRANSACTION_TYPE_ID stores the transaction type for the charged line and decides whether material, labor or expense is used. Installed base attributes, such as CUSTOMER_PRODUCT_ID, INSTALLED_CP_RETURN_BY_DATE,NEW_CP_RETURN_BY_DATE, and SYSTEM_ID are used for certain transactions like loaners, advance replacements.

ORDER_HEADER_ID, ORDER_LINE_ID hold order-specific information for the line in Order Entry/Shipping. SELLING_PRICE holds the unit price as obtained from the price list. AFTER_WARRANTY_COST holds the final amount to charge, after all contracts/discounts have been applied.

The primary key of this table is ESTIMATE_DETAIL_ID.

CS_INCIDENTS_ALL_B

CS_INCIDENTS_ALL_B stores information about service requests. A service request can be logged against any product, any product in inventory, or any product in the install base. Each row contains information about a single service request. This table is partitioned by ORG_ID in a multi-organizational environment. This is the multi-language support base table and contains all of the fields from this table that are not translatable.

MTL_SYSTEM_ITEMS_B

MTL_SYSTEM_ITEMS_B is the definition table for items. This table holds the definitions for inventory items, engineering items, and purchasing items. You can specify item-related information in fields such as: Bill of Material, Costing, Purchasing, Receiving, Inventory, Physical attributes, General Planning, MPS/MRP Planning, Lead times, Work in Process, Order Management, and Invoicing.

You can set up the item with multiple segments, since it is implemented as a flexfield. Use the standard 'System Items' flexfield that is shipped with the product to configure your item flexfield. The flexfield code is MSTK.

The primary key for an item is the INVENTORY_ITEM_ID and ORGANIZATION_ID. Therefore, the same item can be defined in more than one organization.

Each item is initially defined in an item master organization. The user then assigns the item to other organizations that need to recognize this item; a row is inserted for each new organization the item is assigned to. Many columns such as MTL_TRANSACTIONS_ENABLED_FLAG and BOM_ENABLED_FLAG correspond to item attributes defined in the MTL_ITEM_ATTRIBUTES table. The attributes that are available to the user depend on which Oracle applications are installed. The table MTL_ATTR_APPL_DEPENDENCIES maintains the relationships between item attributes and Oracle applications.

Two unit of measure columns are stored in MTL_SYSTEM_ITEMS table. PRIMARY_UOM_CODE is the 3-character unit that is used throughout Oracle Manufacturing. PRIMARY_UNIT_OF_MEASURE is the 25-character unit that is used throughout Oracle Purchasing.

Items now support multilingual description. MLS is implemented with a pair of tables: MTL_SYSTEM_ITEMS_B and MTL_SYSTEM_ITEMS_TL. Translations table (MTL_SYSTEM_ITEMS_TL) holds item descriptions in multiple languages. DESCRIPTION column in the base table (MTL_SYSTEM_ITEMS_B) is for backward compatibility and is maintained in the installation base language only.

Database Triggers

Trigger Name : MTL_SYSTEM_ITEMS_B_T2_IBE
 Trigger Time : AFTER
 Trigger Level : ROW
 Trigger Event : DELETE

This trigger calls iStore procedures to update relationships, section-items and search tables that depend on MTL_SYSTEM_ITEMS_B table.

Trigger Name : MTL_SYSTEM_ITEMS_B_T3_IBE
 Trigger Time : AFTER
 Trigger Level : ROW
 Trigger Event : UPDATE

This trigger calls iStore procedures to update relationships and section-items tables that depend on MTL_SYSTEM_ITEMS_B table.

Trigger Name : MTL_SYSTEM_ITEMS_T6_BOM
 Trigger Time : AFTER
 Trigger Level : ROW
 Trigger Event : INSERT

This trigger creates categories corresponding to product family items being created. It also assigns product family items to their corresponding categories. The trigger uses data that has been stored in the BOM_PFI_PVT package PL/SQL tables by the row level trigger.

Trigger Name : MTL_SYSTEM_ITEMS_T1_BOM
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : INSERT

This trigger stores product family item identifier used later by the statement level trigger for creation of the corresponding category when a new product family item is defined. It makes calls to the BOM_PFI_PVT package procedures.

Trigger Name : MTL_SYSTEM_ITEMS_B_T2_BOM
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : DELETE

This trigger stores corresponding category identifier that is used later by the statement level trigger for deletion of the category when the product family item is deleted. It makes calls to BOM_PFI_PVT package procedures.

Trigger Name : MTL_SYSTEM_ITEMS_T3_BOM
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : UPDATE

This trigger performs the following functions depending on conditions: 1. Creates product family category when item attribute BOM_ITEM_TYPE is updated to 5. 2. When the item attribute BOM_ITEM_TYPE is changed from 5 to any other value, the trigger stores corresponding category identifier for later deletion of the category by the statement level trigger. 3. Removes an item assignment to the corresponding product family category when the PRODUCT_FAMILY_ITEM_ID column of that item is changed. 4. When the PRODUCT_FAMILY_ITEM_ID column is changed to non-null, stores category ID in the BOM_PFI_PVT package PL/SQL table for an item assignment to that category later by the statement-level trigger.

Trigger Name : MTL_SYSTEM_ITEMS_T4_BOM
Trigger Time : AFTER
Trigger Level : STATEMENT
Trigger Event : UPDATE

This trigger performs the following functions depending on updates of the BOM_ITEM_TYPE and PRODUCT_FAMILY_ITEM_ID columns: 1. Creates categories corresponding to product family items. 2. Assigns new product family items to their corresponding categories. 3. Deletes product family categories. The trigger uses data that has been stored in the BOM_PFI_PVT package PL/SQL tables by the row level trigger.

Trigger Name : MTL_SYSTEM_ITEMS_T5_BOM
Trigger Time : AFTER
Trigger Level : ROW
Trigger Event : DELETE

This trigger deletes categories corresponding to product family items being deleted. The trigger uses data that has been stored in the BOM_PFI_PVT package PL/SQL tables by the row level trigger.

Trigger Name : MTL_SYSTEM_ITEMS_T1
Trigger Time : BEFORE
Trigger Level : ROW
Trigger Event : UPDATE

The trigger is executed when the `COSTING_ENABLED_FLAG` field in the `MTL_SYSTEM_ITEMS` table is modified from Yes to No or vice versa. Before updating `COSTING_ENABLED_FLAG` field, the trigger performs the following tasks for each record that is modified:

- Insert a record into `CST_ITEM_COSTS` table if `COSTING_ENABLED_FLAG` field is changed from No to Yes.
- Delete a record from `CST_ITEM_COSTS` table if `COSTING_ENABLED_FLAG` field is changed from Yes to No.

MTL_UNITS_OF_MEASURE_TL

MTL_UNITS_OF_MEASURE_TL is the definition table for both the 25-character and the 3-character units of measure. The base_uom_flag indicates if the unit of measure is the primary unit of measure for the uom_class. Oracle Inventory uses this table to keep track of the units of measure used to transact an item. This table is also used by Oracle Purchasing, Oracle Order Management and Oracle Shipping Execution.

OKC_K_LINES_B

A CONTRACT LINE is a supertype of CLIN (contract line item number), SUBCLIN and LINE DETAIL which group a set of deliverable ITEMS into a logical set usually defined by unitary price, delivery or some other classification. It also provides an association point for any specific RULES governing the performance of that particular delivery. LINES are hierarchical. A LINE may have children and may belong to one parent line. The topmost line (called the top line) has no LINE as its parent, but belongs to the CONTRACT HEADER. A RULE or PARTY association for a LINE flows down to all child lines until overridden. Each CONTRACT LINE must be of a specified LINE STYLE. This controls from where the LINE may source its data and what types of lines it may have as its children. Different SUBCLASSES of contracts may have different LINE STYLE hierarchies.

WIP_DISCRETE_JOBS

WIP_DISCRETE_JOBS stores discrete job information. Each row represents a discrete job, and contains information about the assembly being built, the revision of the assembly, the job quantity, the status of the job, the material control method, accounting information, and job schedule dates. Oracle Work in Process uses this information to control discrete production.

Database Triggers

Trigger Name : WIP_DISCRETE_JOBS_T5
 Trigger Time : BEFORE
 Trigger Level : ROW
 Trigger Event : UPDATE

WIP_DISCRETE_JOBS_T5 calls PJM_PROJECT_LOCATOR.GET_JOB_PROJECTSUPPLY in order to update the locator for the project, if any, that is associated with the job being updated.

Trigger Name : WIP_DISCRETE_JOBS_BRU
 Trigger Time : BEFORE
 Trigger Level : ROW
 Trigger Event : UPDATE

WIP_DISCRETE_JOBS_BRU calls the procedure WIP_MRP_RELIEF.WIP_DISCRETE_JOBS_PROC if the status_type of the job is (or was) < 7 and the job is a standard discrete job. This procedure inserts rows into the table MRP_RELIEF_INTERFACE to do MPS relief.

Trigger Name : WIP_DISCRETE_JOBS_BRD
 Trigger Time : BEFORE
 Trigger Level : ROW
 Trigger Event : DELETE

WIP_DISCRETE_JOBS_BRD calls the procedure WIP_MRP_RELIEF.WIP_DISCRETE_JOBS_PROC if the status_type of the job was < 7 and the job is a standard discrete job. This procedure inserts rows into the table MRP_RELIEF_INTERFACE to do MPS relief.

Trigger Name : WIP_DISCRETE_JOBS_T4
 Trigger Time : BEFORE
 Trigger Level : ROW
 Trigger Event : INSERT

WIP_DISCRETE_JOBS_T4 calls PJM_PROJECT_LOCATOR.GET_JOB_PROJECTSUPPLY in order to find a locator for the project, if any, that is associated with the job being created.

WIP_ENTITIES

WIP_ENTITIES stores information about jobs, repetitive assemblies, and flow schedules. Each row includes a unique entity name, the entity type, and the assembly being built. Oracle Work in Process uses this information to control production activities and to ensure that entities with duplicate names are not created.

Oracle Depot Repair Technical Reference Manual A83686-01

Oracle Corporation welcomes your comments and suggestions on the quality and usefulness of this publication. Your input is an important part of the information we use for revision.

- Did you find any errors?
- Is the information clearly presented?
- Do you need more information? If so, where?
- Are the examples correct? Do you need more examples?
- What features did you like most about this manual? What did you like least about it?

If you find any errors or have any other suggestions for improvement, please indicate the topic, chapter, and page number below:
