This Technical Reference Manual (TRM) in any form, software or printed matter, contains proprietary information of Oracle Corporation; it is provided under an Oracle Corporation agreement containing restrictions on use and disclosure and is also protected by copyright, patent, and other intellectual property law. Restrictions applicable to this TRM include, but are not limited to: (a) exercising either the same degree of care to safeguard the confidentiality of this TRM as you exercise to safeguard the confidentiality of your own most important Confidential Information or a reasonable degree of care, whichever is greater; (b) maintaining agreements with your employees and agents that protect the Confidential Information of third parties such as Oracle Corporation and instructing such employees and agents of these requirements for this TRM; (c) restricting disclosure of this TRM to those of your employees who have a "need to know" consistent with the purposes for which this TRM was disclosed to you; (d) maintaining this TRM at all times on your premises; (e) not removing or destroying any proprietary or confidential legends or markings placed upon this TRM in whatever form, software or printed matter; and (f) not reproducing or transmitting this TRM in any form or by any means, electronic or mechanical, for any purpose, without the express written permission of Oracle Corporation. You should not use this TRM in any form, software or printed matter, to create software that performs the same or similar functions as any Oracle Corporation products.

The information in this TRM is subject to change without notice. If you find any problems in the TRM in any form, software or printed matter, please report them to us in writing. Oracle Corporation does not warrant that this TRM is error-free. This TRM is provided to customer "as-is" with no warranty of any kind. This TRM does not constitute Documentation as that term is defined in Oracle's agreements.

Reverse engineering of the Programs (software and documentation) associated with this TRM are prohibited. The Programs associated with this TRM are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be licensee's responsibility to take all appropriate fail-safe, back-up, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and Oracle disclaims liability for any damages caused by such use of the Programs.

#### Restricted Rights Legend

This TRM and the Programs associated with this TRM delivered subject to the DOD FAR Supplement are 'commercial computer software' and use, duplication and disclosure of the TRM and the Programs associated with this TRM shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement. Otherwise, this TRM and the Programs associated with this TRM delivered subject to the Federal Acquisition Regulations are 'restricted computer software' and use, duplication and disclosure of the TRM and the Programs associated with this TRM shall be subject to the restrictions in FAR 52.227-14, Rights in Data — General, including Alternate III (June 1987). # Introduction

**T**he Oracle Receivables Applications Technical Reference Manual provides the information you need to understand the underlying structure of Oracle Receivables and Oracle Public Sector Receivables. After reading this manual, you should be able to convert your existing applications data, integrate your existing applications with your Oracle Receivables application, and write custom reports for your Oracle Receivables application, as well as read data that you need to perform other tasks.

This chapter introduces you to the Oracle Receivables Applications Technical Reference Manual, and explains how to use it.

---

# Introduction

At Oracle, we design and build applications using Oracle Designer, our systems design technology that provides a complete environment to support developers through all stages of a systems life cycle. Because we use a repository-based design toolset, all the information regarding the underlying structure and processing of our applications is available to us online. Using Oracle Designer, we can present this information to you in the form of a technical reference manual.

This Oracle Receivables Applications Technical Reference Manual contains detailed, up-to-date information about the underlying structure of Oracle Receivables and Oracle Public Sector Receivables. As we design and build new releases of Oracle Receivables applications, we update our Oracle Designer repository to reflect our enhancements. As a result, we can always provide you with an Oracle Receivables Applications Technical Reference Manual that contains the latest technical information as of the publication date. Note that after the publication date we may have added new indexes to Oracle Receivables and Oracle Public Sector Receivables to improve performance.

---

## About this Manual

This manual describes the Oracle Applications Release 11i data model, as used by Oracle Receivables; it discusses the database we include with a fresh install of Oracle Applications Release 11i. If you have not yet upgraded to Release 11i, your database may differ from the database we document in this book.

If you have upgraded from a previous release, you might find it helpful to use this manual with the appropriate *Oracle Applications Product Update Notes* manual. The product update notes list database changes and seed data changes in Oracle Receivables and Oracle Public Sector Receivables between releases. The *Oracle Applications Product Update Notes Release 11* manual describes the changes between Release 10.7 and Release 11, and the *Oracle Applications Product Update Notes Release 11i* manual describes the changes between Release 11 and Release 11i.

You can contact your Oracle representative to confirm that you have the latest technical information for Oracle Receivables. You can also use *OracleMetaLink* which is accessible through Oracle's Support Web Center ([http://www.oracle.com/support/elec\\_sup](http://www.oracle.com/support/elec_sup)).

---

## Finding the Latest Information

The Oracle Receivables Applications Technical Reference Manual contains the latest information as of the publication date. For the latest information we encourage you to use Oracle *MetaLink* which is accessible through Oracle's Support Web Center ([http://www.oracle.com/support/elec\\_sup](http://www.oracle.com/support/elec_sup)).

---

## Audience

The Oracle Receivables Applications Technical Reference Manual provides useful guidance and assistance to:

- Technical End Users
- Consultants
- Systems Analysts
- System Administrators
- Other MIS professionals

This manual assumes that you have a basic understanding of structured analysis and design, and of relational databases. It also assumes that you are familiar with Oracle Application Object Library and your Oracle Receivables application. If you are not familiar with the above products, we suggest that you attend one or more of the training classes available through Oracle Education (see: Other Information Sources: page 1 – 8).

### **Documentation Accessibility**

---

Oracle's goal is to make our products, services, and supporting documentation accessible to the disabled community with good usability. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Standards will continue to evolve over time, and Oracle is actively engaged with other market-leader technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For additional information, visit the Oracle Accessibility Program web site at <http://www.oracle.com/accessibility/>.

## **Public Sector and Other Industry-specific Products**

---

For certain products, including Oracle Receivables, Oracle provides several distinct software versions tailored for a specific industry or vertical, containing additional functionality not present in the base or non-vertical-specific product.

The data model for Oracle Receivables supports a superset of all the functionality used by a vertical-specific version of Oracle Receivables, including the Oracle Public Sector Financials version of Oracle Receivables. Therefore, you can use this manual in conjunction with Oracle Public Sector General Ledger, Oracle Public Sector Payables, Oracle Public Sector Purchasing, or Oracle Public Sector Receivables.

---

## **How This Manual is Organized**

This manual contains two major sections, High-Level Design and Detailed Design.

### **High-Level Design**

---

This section, Chapter 2, contains database diagrams and lists each database table and view that Oracle Receivables uses. This chapter also has a list of modules.

### **Detailed Design**

---

This section, Chapter 3, contains a detailed description of the Oracle Receivables database design, including information about each database table and view you might need for your custom reporting or other data requirements.

---

## How to Use This Manual

The Oracle Receivables Applications Technical Reference Manual is a single, centralized source for all the information you need to know about the underlying structure and processing of your Oracle Receivables application. For example, you can use this manual when you need to:

- Convert existing application data
- Integrate your Oracle Receivables application with your other applications systems
- Write custom reports
- Define alerts against Oracle Applications tables
- Configure your Oracle Self-Service Web Applications
- Create views for decision support queries using query tools
- Create business views for Oracle Discoverer

You need not read this manual cover to cover. Use the table of contents and index to quickly locate the information you need.

---

## How Not To Use This Manual

---

### **Do not use this manual to plan modifications**

You should not use this manual to plan modifications to your Oracle Receivables application. Modifying Oracle Receivables and Oracle Public Sector Receivables limits your ability to upgrade to future releases of your Oracle Receivables application. In addition, it interferes with our ability to give you the high-quality support you deserve.

We have constructed your Oracle Receivables application so that you can customize it to fit your needs without programming, and you can integrate it with your existing applications through interface tables. However, should you require program modifications, you should contact our support team (see: Other Information Sources: page 1 – 8). They can put you in touch with Oracle Services, the professional consulting organization of Oracle. Their team of experienced applications professionals can make the modifications you need while ensuring upward compatibility with future product releases.

### **Do not write data into non-interface tables**

Oracle reserves the right to change the structure of Oracle Applications tables, and to change the meaning of, add, or delete lookup codes and data in future releases. Do not write data directly into or change data in non-interface tables using SQL\*Plus or other programming tools because you risk corrupting your database and interfering with our ability to support you.

Moreover, this version of the Oracle Receivables Applications Technical Reference Manual does not contain complete information about the dependencies between Oracle Receivables applications tables. Therefore, you should write data into only those tables we identify as interface tables. If you write data into other non-interface tables, you risk violating your data integrity since you might not fulfill all the data dependencies in your Oracle Receivables application.

You are responsible for the support and upgrade of the logic within the procedures that you write, which may be affected by changes between releases of Oracle Applications.

### **Do not rely on upward compatibility of the data model**

Oracle reserves the right to change the structure of Oracle Receivables applications tables, and to change the meaning of, add, or delete lookup codes and other data in future releases. We do not guarantee the upward compatibility of the Oracle Receivables applications data model. For example, if you write a report that identifies concurrent requests that end in Error status by selecting directly from Oracle Application Object Library tables, we do not guarantee that your report will work properly after an upgrade.

---

## **About Oracle Application Object Library**

The Oracle Receivables Applications Technical Reference Manual may contain references to tables that belong to Oracle Application Object Library. Oracle Application Object Library is a collection of pre-built application components and facilities for building Oracle Applications and extensions to Oracle Applications. Oracle Application Coding Standards use the Oracle Application Object Library and contains shared components including but not limited to -- forms, subroutines, concurrent programs and reports, database tables and objects, messages, menus, responsibilities, flexfield definitions and online help.

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

**Attention:** Oracle does not support any customization of Oracle Application Object Library tables or modules, not even by Oracle consultants. (Oracle Application Object Library tables generally have names beginning with FND\_%.)

Accordingly, this manual does not contain detailed information about most Oracle Application Object Library tables used by your Oracle Receivables application.

---

## A Few Words About Terminology

The following list provides you with definitions for terms that we use throughout this manual:

### **Relationship**

---

A relationship describes any significant way in which two tables may be associated. For example, rows in the Journal Headers table may have a one-to-many relationship with rows in the Journal Lines table.

### **Database Diagram**

---

A database diagram is a graphic representation of application tables and the relationships between them.

### **Summary Database Diagram**

---

A summary database diagram shows the most important application tables and the relationships between them. It omits tables and relationships that contribute little to the understanding of the application data model. Typically, a summary database diagram shows tables that contain key reference and transaction data.

### **Module**

---

A module is a program or procedure that implements one or more business functions, or parts of a business function, within an application. Modules include forms, concurrent programs and reports, and subroutines.

### **Application Building Block**

---

An application building block is a set of tables and modules (forms, reports, and concurrent programs) that implement closely-related

database objects and their associated processing. Said another way, an application building block is a logical unit of an application.

---

### **QuickCodes**

QuickCodes let you define general purpose, static lists of values for window fields. QuickCodes allow you to base your program logic on lookup codes while displaying user-friendly names in a list of values window. QuickCodes simplify name and language changes by letting you change the names your end users see, while the codes in your underlying programs remain the same.

---

### **Form**

A form is a module comprised of closely related windows that are used together to perform a task. For example, the Enter Journals form in Oracle General Ledger includes the Enter Journals window, the Batch window, and the More Actions window among others. The Enter Journals window is the main window, and from it, you can use buttons to navigate to other windows in the form. The form name usually corresponds to the main window in the form, and is frequently a window you open directly from the Navigator.

---

## **Other Information Sources**

There are additional information sources, including other documentation, training and support services, that you can use to increase your knowledge and understanding of Oracle Designer, Oracle Application Object Library, and your Oracle Receivables application. We want to make these products easy for you and your staff to understand and use.

---

### **Oracle Designer Online Documentation**

The online help for Oracle Designer describes how you can use Oracle Designer for your development needs.

---

### **Oracle Applications Developer's Guide**

This guide contains the coding standards followed by the Oracle Applications development staff. It describes the Oracle Application Object Library components needed to implement the Oracle Applications user interface described in the *Oracle Applications User*

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

*Interface Standards.* It also provides information to help you build your custom Developer forms so that they integrate with Oracle Applications.

---

### **Oracle Applications User Interface Standards**

This manual contains the user interface (UI) standards followed by the Oracle Applications development staff. It describes the UI for the Oracle Applications products and how to apply this UI to the design of an application built using Oracle Forms 6.

### **Oracle Receivables User Guide**

---

#### **Oracle Public Sector Receivables User Guide**

Your user guide provides you with all the information you need to use your Release 11i Oracle Receivables application. Each user guide is organized for fast, easy access to detailed information in a function- and task-oriented organization.

---

### **Oracle Global Financial Applications Technical Reference Manual**

This manual describes additional tables and views that have been added to support features that meet statutory requirements and common business practices in your country or region. The Appendix of this manual also describes how the GLOBAL\_ATTRIBUTE columns of your base product tables are used in your country or region.

---

### **Country-Specific Manuals**

Use these manuals to meet statutory requirements and common business practices in your country or region. They also describe additional features added to Oracle Receivables to meet those requirements. Look for a user guide appropriate to your country; for example, see the *Oracle Financials for the Czech Republic User Guide* for more information about using this software in the Czech Republic.

---

### **Oracle Applications Flexfields Guide**

This guide provides flexfields planning, setup and reference information for the Oracle Receivables implementation team, as well as for users responsible for the ongoing maintenance of Oracle Applications product data. This manual also provides information on creating custom reports on flexfields data.

## **Oracle Workflow Guide**

---

This manual explains how to define new workflow business processes as well as customize existing Oracle Applications–embedded workflow processes. You also use this guide to complete the setup steps necessary for any Oracle Applications product that includes workflow–enabled processes.

## **Oracle Alert User Guide**

---

This manual explains how to define periodic and event alerts to monitor the status of your Oracle Applications data.

## **Multiple Reporting Currencies in Oracle Applications**

---

If you use the Multiple Reporting Currencies feature to report and maintain accounting records in more than one currency, use this manual before implementing Oracle Receivables. This manual details additional steps and setup considerations for implementing Oracle Receivables with this feature.

## **Multiple Organizations in Oracle Applications**

---

If you use the Oracle Applications Multiple Organization Support feature to use multiple sets of books for one Oracle Receivables installation, use this guide to learn about setting up and using Oracle Receivables with this feature. This book describes the Oracle Applications organization model, which defines business units and the relationships between them in an arbitrarily complex enterprise. Functional and technical overviews of multiple organizations are presented, as well as information about how to set up and implement this feature set in the relevant Oracle Applications products.

## **Oracle Financials Open Interfaces Guide**

---

This document contains a brief summary of all open interface discussions in all Oracle Financial Applications user guides.

## **Oracle Manufacturing, Distribution, Sales and Service Open Interfaces Manual**

---

This manual contains up–to–date information about integrating with other Oracle Manufacturing applications and with your other systems. This documentation includes open interfaces found in Oracle Manufacturing.

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

## **Oracle Applications Messages Manual**

---

The Oracle Applications Messages Manual contains the text of numbered error messages in Oracle Applications. (Oracle Applications messages begin with the prefix "APP-".) It also provides information on the actions you take if you get a message. Note: This manual is available only in HTML format.

## **Oracle Public Sector Financials Messages Manual**

---

This manual contains the text of numbered error messages in Oracle Public Sector Financials and related Oracle Applications products. (Oracle Applications messages begin with the prefix "APP-".) It also provides information on the actions you take if you get a message. Note: This manual is available only in HTML format.

## **Installation and System Administration**

### **Oracle Applications Installation Release Notes**

---

This manual contains a road map to the components of the release, including instructions about where to access the Release 11i documentation set.

### **Oracle Applications Concepts**

---

Designed to be the first book the user reads to prepare for an installation of Oracle Applications. It explains the technology stack, architecture, features and terminology for Oracle Applications Release 11i. This book also introduces the concepts behind and major uses of Applications-wide features such as MRC, BIS, languages and character sets (NLS, MLS), BIS, Self-Service Web Applications and so on.

### **Installing Oracle Applications**

---

Describes the One-Hour Install process, the method by which Release 11i will be installed. This manual includes all how-to steps, screen shots and information about Applications-wide post-install tasks.

### **Using the AD Utilities**

---

This manual contains how-to steps, screen shots and other information required to run the various AD utilities such as AutoInstall, AutoPatch, AD Administration, AD Controller, Relink and so on. It also contains information about when and why you should use these utilities.

**Oracle Proprietary, Confidential Information—Use Restricted by Contract**

## **Upgrading Oracle Applications**

This manual contains all the product specific pre- and post-upgrade steps that are required to upgrade products from Release 10.7 (NCA, SC and character-mode) or Release 11 of Oracle Applications. This manual also contains an overview chapter that describes all the tasks necessary to prepare and complete a upgrade of Oracle Applications.

## **Oracle Applications System Administrator's Guide**

This manual provides planning and reference information for the Oracle Applications System Administrator. It contains information on how to define security, customize menus and manage concurrent processing.

## **Oracle Applications Product Update Notes**

This book contains a summary of each new feature we added since Release 11, as well as information about database changes and seed data changes that may affect your operations or any custom reports you have written. If you are upgrading from Release 10.7 you also need to read *Oracle Applications Product Update Notes Release 11*.

## **Oracle Self-Service Web Applications Implementation Manual**

This manual describes the setup steps for Oracle Self-Service Web Applications and the Web Applications Dictionary.

## **Oracle Applications Implementation Wizard User Guide**

If you are implementing more than one Oracle product, you can use the Oracle Applications Implementation Wizard to coordinate your setup activities. This guide describes how to use the wizard.

## **Other Information**

### **Training**

Oracle Education offers a complete set of training courses to help you and your staff master Oracle Applications. We can help you develop a training plan that provides thorough training for both your project team and your end users. We will work with you to organize courses appropriate to your job or area of responsibility.

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

Training professionals can show you how to plan your training throughout the implementation process so that the right amount of information is delivered to key people when they need it the most. You can attend courses at any one of our many Educational Centers, or you can arrange for our trainers to teach at your facility. In addition, we can tailor standard courses or develop custom courses to meet your needs.

## **Support**

---

From on-site support to central support, our team of experienced professionals provides the help and information you need to keep your Oracle Receivables application working for you. This team includes your Technical Representative, Account Manager, and Oracle's large staff of consultants and support specialists with expertise in your business area, managing an Oracle server, and your hardware and software environment.

---

## **About Oracle**

Oracle Corporation develops and markets an integrated line of software products for database management, applications development, decision support, and office automation, as well as Oracle Applications, an integrated suite of more than 75 software modules for financial management, supply chain management, manufacturing, project systems, human resources, and sales and service management.

Oracle products are available for mainframes, minicomputers, personal computers, network computers, and personal digital assistants, allowing organizations to integrate different computers, different operating systems, different networks, and even different database management systems, into a single, unified computing and information resource.

Oracle is the world's leading supplier of software for information management, and the world's second largest software company. Oracle offers its database, tools, and applications products, along with related consulting, education, and support services, in over 145 countries around the world.

## CHAPTER

# 2

# High-Level Design

**T**his chapter presents a high-level design for Oracle Receivables and Oracle Public Sector Receivables that satisfies the business needs we specify during Strategy and Analysis. It contains database diagrams for Oracle Receivables and Oracle Public Sector Receivables application building blocks, lists of database tables and views, and a list of modules.

---

## Overview of High-Level Design

During High-Level Design, we define the application components (tables, views, and modules) we need to build our application. We specify what application components should do without specifying the details of *how* they should do it.

You can refer to this High-Level Design chapter to quickly acquaint yourself with the tables, views, and modules that comprise Oracle Receivables applications. And, you can prepare yourself to understand the detailed design and implementation of Oracle Receivables and Oracle Public Sector Receivables.

---

## Summary Database Diagram

The Summary Database Diagram section graphically represents the most important application tables and the relationships between them. It omits tables and relationships that contribute little to the understanding of the application data model. Typically, a summary database diagram shows tables that contain key reference and transaction data.

We prepare a summary database diagram to describe, at a conceptual level, the key information on which our business depends. Later, we refine this summary database diagram, breaking it into multiple database diagrams (generally, one per application building block) to represent all the tables and relationships we need to implement our application in the database.

Review the Summary Database Diagram section to see at a glance the major tables and relationships on which your Oracle Receivables application depends.

---

## Database Diagrams

The Database Diagrams section graphically represents all Oracle Receivables applications tables and the relationships between them, organized by building block.

Use this section to quickly learn what tables each Oracle Receivables application building block uses, and how those tables interrelate. Then, you can refer to the Table and View Definitions sections of Chapter 3 for more detailed information about each of those tables.

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

---

## Table Lists

The Table List sections list the Oracle Receivables applications tables. Because a product might not include at least one table for each type, this Technical Reference Manual might not include each of the following sections.

### Public Tables

---

Use the Public Table List section to quickly identify the tables you are most interested in. Then, you can refer to the Table and View Definitions sections of Chapter 3 for more detailed information about those tables.

In addition, this manual may contain full documentation for one or more of the following Application Object Library tables: FND\_DUAL, FND\_CURRENCIES, and FND\_COMMON\_LOOKUPS.

### Internal Tables

---

This section includes a list of private, internal tables used by Oracle Receivables; we do not provide additional documentation for these tables.

---

## View Lists

The View List sections list the Oracle Receivables views, with one section for each type of view. Because a product might not include at least one view for each type, this Technical Reference Manual might not include each of the following sections.

Use this section to quickly identify the views you are most interested in. Then, you can refer to the Table and View Definitions sections of Chapter 3 for more detailed information about those views.

### Public Views

---

This section lists views that may be useful for your custom reporting or other data requirements. The list includes a description of the view, and the page in Chapter 3 that gives detailed information about the public view.

## **Web Views**

---

This section lists views that you may need to configure your Self-Service Web applications. The list includes a description of the view, and the page in Chapter 3 that gives detailed information about the web view.

## **Forms and Table Views**

---

This section lists supplementary views that are not essential to the Release 11i data model, but simplify coding or improve performance for Oracle Developer.

## **Internal Views**

---

This section includes each private, internal view that Oracle Receivables uses.

## **Single-Organization Views**

---

This section lists the Oracle Receivables views that we added to take the place of various tables that are now partitioned by operating unit, to support multiple sets of books within a single installation of Oracle Receivables.

## **Multiple Reporting Currency Views**

---

This list includes views that were created to support the Multiple Reporting Currencies feature.

---

## **Module List**

The Module List section briefly describes each of the Oracle Receivables applications modules. This section lists forms, reports, and concurrent programs.

A form is a module comprised of closely related windows that are used together to perform a task. For example, the Enter Journals form in Oracle General Ledger includes the Enter Journals window, the Batch window, and the More Actions window. The Enter Journals window is the main window, and from it, you can use buttons to navigate to other windows in the form. The form name usually corresponds to the main window in the form, and is frequently a window you can open directly from the Navigator.

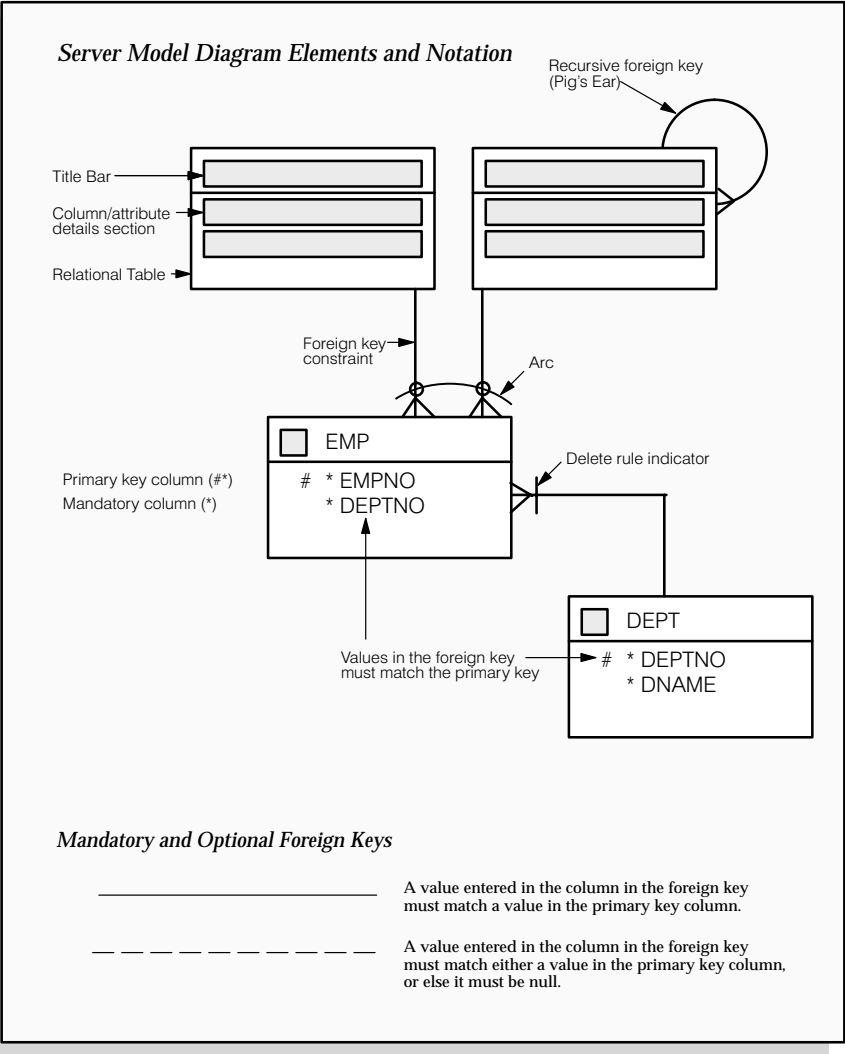

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

The Reports and Concurrent Programs lists include processes you can submit from the Submit Requests window or other windows, as well as processes that are submitted automatically by Oracle Receivables. Use your user guide to learn more about reports and concurrent processes.

# Database Diagramming Conventions

Figure 2 – 1  
Database Diagram  
Conventions

We use the following notational conventions in our database diagrams:

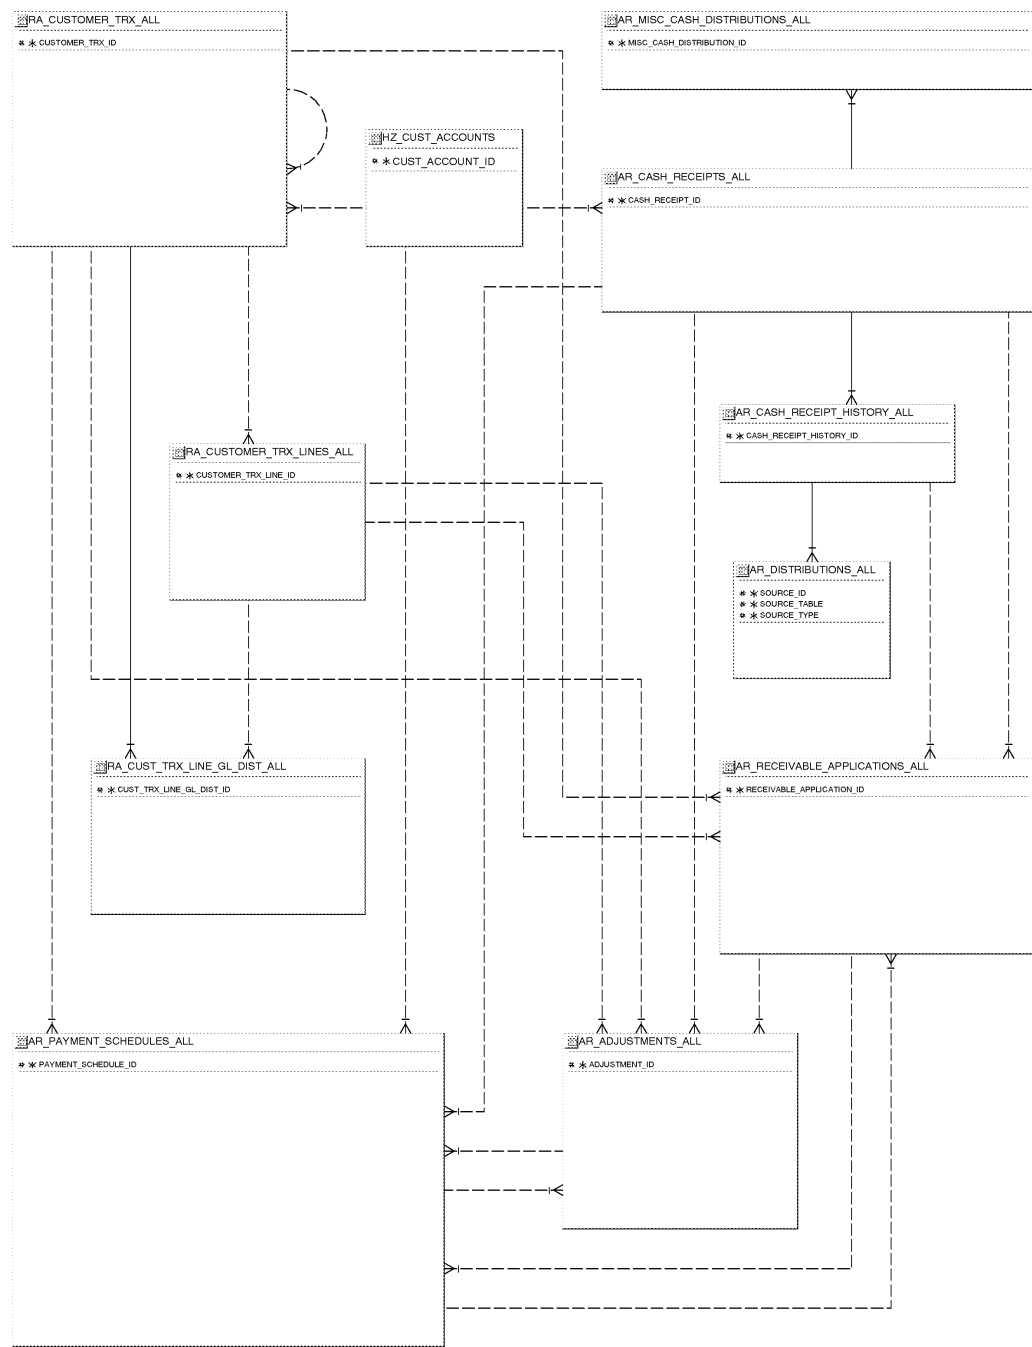

**Tables** – are the basic unit of storage in the database. A hand symbol preceding the title in the table's title bar indicates that the table is not owned by this application but shared with another.

**Foreign key constraint** – is a type of referential integrity constraint for checking the integrity of data entered in a specific column or set of columns. This specified column or set of columns is known as the foreign key.

**Delete rule indicator** – determines the action to be taken when an attempt is made to delete a related row in a join table. A line through the foreign key constraint, as shown on the above diagram, indicates that this action is restricted.

**Arcs** – specify that, for any given row in a table, a value must be entered in one of the arc columns. The remaining columns within the arc must be null.

## Database Diagrams

This section graphically represents most of the significant Oracle Receivables applications tables and the relationships between them, organized by building block. Use this section to quickly learn what tables each Oracle Receivables application building block uses, and how these tables interrelate. Then, you can refer to the Table and View Definitions sections of Chapter 3 for more detailed information about each of those tables.

This section contains a database diagram for each of the following Oracle Receivables application building blocks:

- Diagram 1: Customer Interface
- Diagram 2: Customers
- Diagram 3: Customer Usage
- Diagram 4: Tax Groups
- Diagram 5: Transactions
- Diagram 6: Bills Receivable
- Diagram 7: Sales Tax Interface

Some tables, especially important reference tables, appear in more than one database diagram. When several building blocks use a table, we show that table in each appropriate database diagram.

---

### Customer Interface

Diagram 1 shows the tables and relationships that show imported customer data. This information includes original system customer

number, original address reference numbers, customer site, and interface status.

---

### **Customers**

Diagram 2 shows the tables and relationships that store information about your customers, such as customer addresses, business purposes, contacts, telephone numbers, relationships, and classes.

---

### **Customer Usage**

Diagram 3 shows the tables and relationships that store information about customers and transactions. The information includes customer calls, payment schedules, and correspondence.

---

### **Tax Groups**

Diagram 4 shows the tables and relationships that store information about your tax groups. Tax groups let you calculate multiple, conditional taxes automatically based on the Ship To Province, State, Country, or Tax Classification of the Bill To customer.

---

### **Transactions**

Diagram 5 shows the tables and relationships that store invoices, credit memos, deposits, and guarantees. You can see how shipment, salesperson, tax, general ledger distribution, receivable application, payment schedule, and adjustment records relate to the tables that store these transactions.

---

### **Bills Receivable**

Diagram 6 shows the tables and relationships that store bills receivable. You can see how bills receivable batch, bills receivable, payment schedules and general ledger distributions relate to each other.

---

### **Sales Tax Interface**

Diagram 7 shows the tables and relationships that store imported tax data. You can see how your customer address and transaction lines relate to sales tax rates and tax authorities.

## **United States Sales Tax**

---

Diagram 8 shows the tables and relationships associated with implementing Sales Tax in Oracle Receivables. You can see the tax information stored in the different tables and how they relate to each other to provide tax information for your transactions.

## **Receipts**

---

Diagram 9 shows the tables and relationships associated with entering invoice and non-invoice related receipts. You can see how receipt batch, receipts, and payment schedules relate to each other.

## **Posting**

---

Diagram 10 shows the tables and relationships that Oracle Receivables Applications uses to transfer batches of transaction records as journal entries from your receivables sub-ledger to your general ledger or general ledger interface area. This information includes general ledger posted date, general ledger start and end dates, a summary or detail posting indicator, and a run journal import indicator.

## **Party**

---

Diagram 11 shows the tables and relationships that store information about parties. The information includes party sites, locations, time zones, certifications, credit rating, and reference.

## **Party Merge**

---

Diagram 12 shows the tables and relationships that store information about the party merge process. The information includes details about the batch that contains the parties to be merged, the tables affected by the merge process, the history of operations performed, and the details of the records affected by the process.

## **Classification**

---

Diagram 13 shows the tables and relationships that store information about classifying entities. The information includes classification categories, the uses, entities using these categories, the codes for each of the categories, the relationships between codes, and the assignment of codes to the relevant entities.

## **Organization**

---

Diagram 14 shows the tables and relationships that store information about organizations, such as industrial classifications, security issued, financial reports, industrial reference, and organization indicators.

## **Person**

---

Diagram 15 shows the tables and relationships that store information about people, such as citizenship, education, employment history, person language, and person interest.

## **Contact Point**

---

Diagram 16 shows the tables and relationships that store contact points and contact restrictions. You can see how contact points and contact restrictions can be assigned to various entities.

---

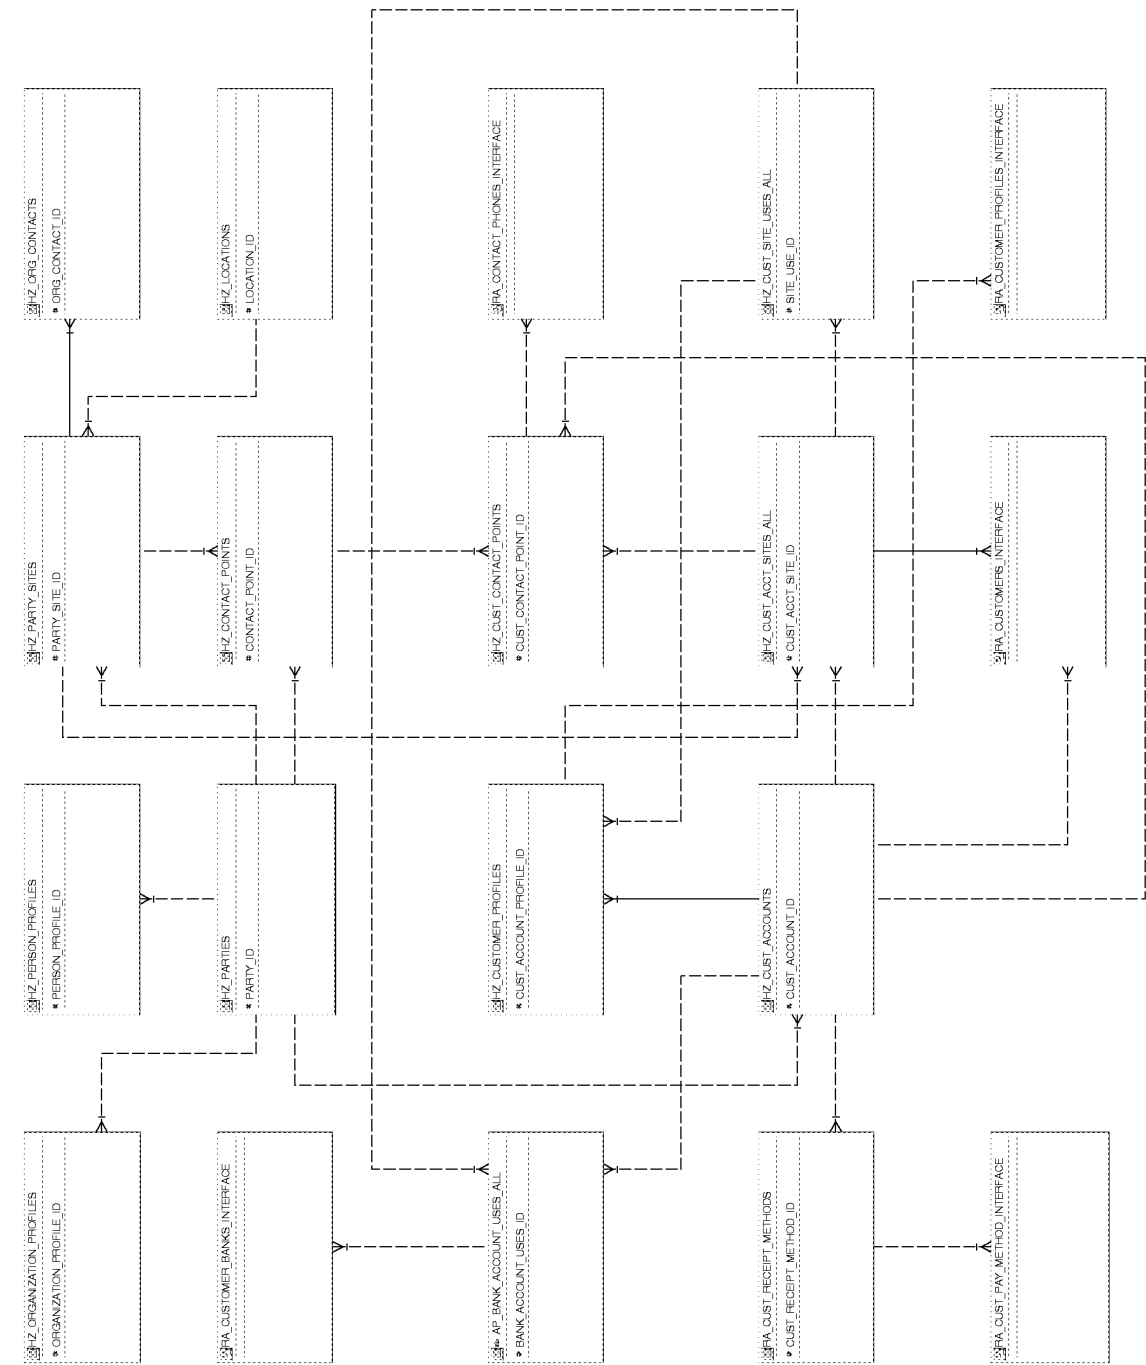

## **How to Use These Database Diagrams**

Following is an example of how you might use these database diagrams:

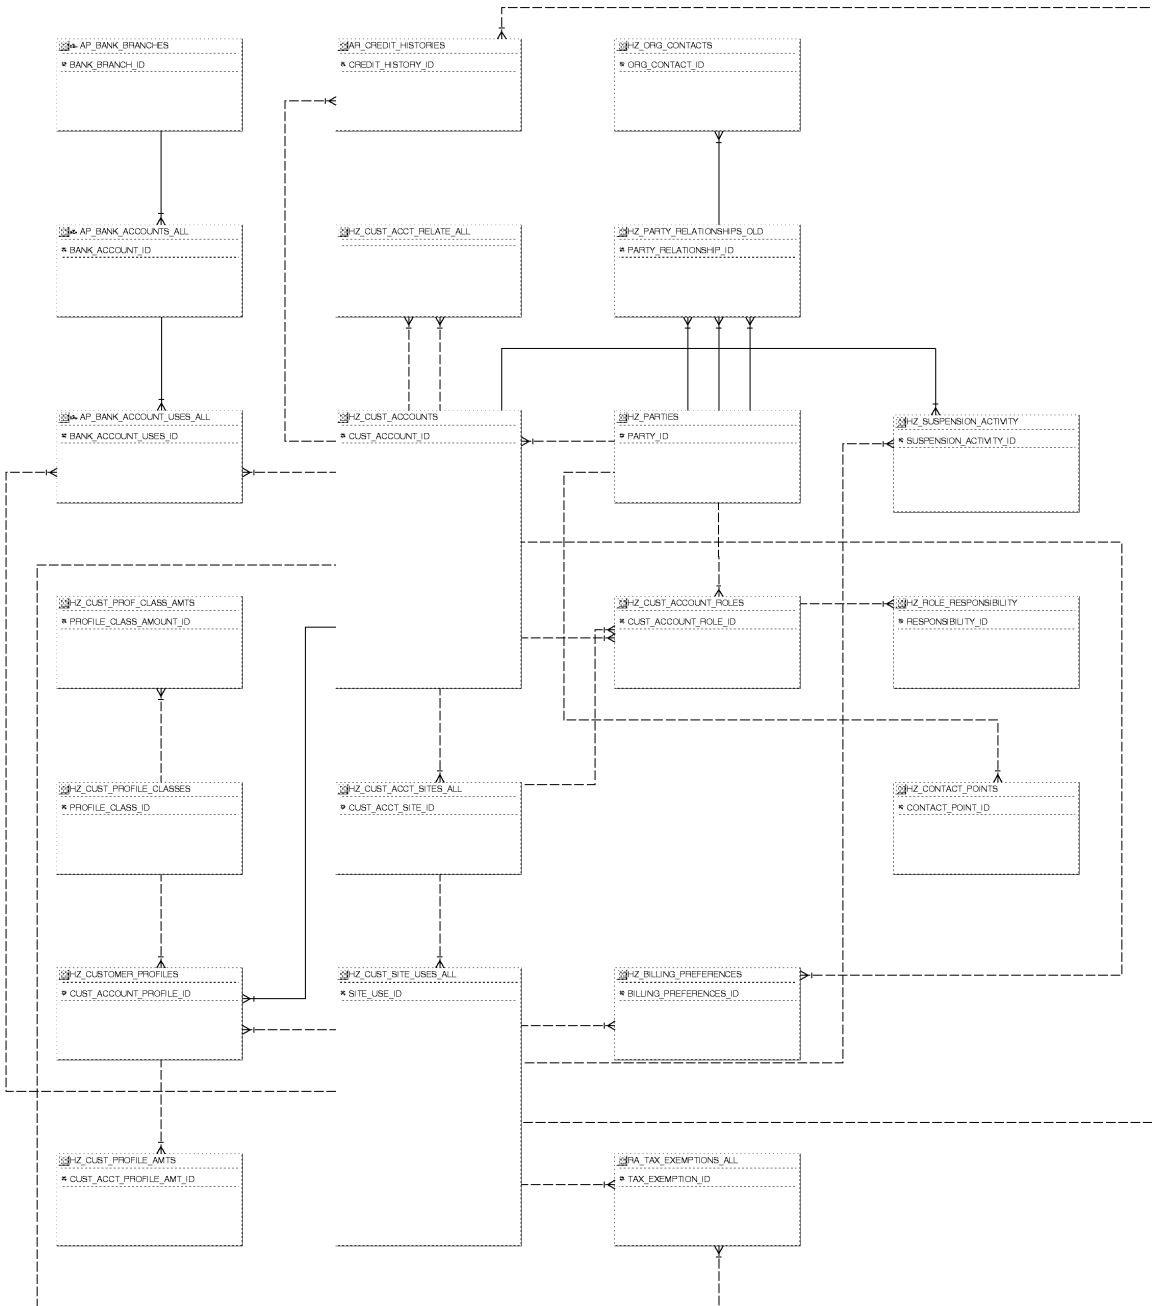

Suppose you want to write a report that summarizes customer profile information for all of the customers that you have entered during the past six months. You turn to the Customers diagram to see the table structure for the Customers building block. You learn that customer profile information is stored in the table HZ\_CUSTOMER\_PROFILES. You see that information on the specific amount of money associated with each customer is stored in the HZ\_CUST\_PROFILE\_AMTS table.

Next, you turn to the Table and View Definitions section in Chapter 3 to learn about the columns in each of these tables. Using this information, you can write a report that shows a summary of customer profile and profile amount information for each customer.

## Public Table List

This section lists each public database table that Oracle Receivables uses and provides a brief description of each of those tables. The page reference is to the table description in Chapter 3.

Note that "public" tables are not necessarily intended for write access by custom code; Oracle Corporation supports write access using only standard Oracle Applications forms, reports, and programs, or any SQL write access to tables explicitly documented as API tables. For more information, see the How Not To Use This Manual section of this book's Introduction.

Oracle Receivables uses the following Public tables:

<b>Table Name</b>	<b>Description</b>
AP_BANK_ACCOUNTS_ALL	Detailed bank account information (See page 3 – 8)
AP_BANK_ACCOUNT_USES_ALL	Information about bank account use by Oracle Payables and Oracle Receivables applications (See page 3 – 13)
AP_BANK_BRANCHES	Detailed bank branch information (See page 3 – 15)
AP_CHECKS_ALL	Supplier payment data (See page 3 – 19)
AP_CHECK_FORMATS	Payment document format records (See page 3 – 27)
AP_CHECK_STOCKS_ALL	Payment document types (See page 3 – 30)
AP_PAYMENT_PROGRAMS	Payment programs used for defining payment formats (See page 3 – 33)
AP_TAX_CODES_ALL	Tax code information (See page 3 – 34)
AR_ACTION_NOTIFICATIONS	Employees to be notified about a particular customer call (See page 3 – 37)
AR_ADJUSTMENTS_ALL	Pending and approved invoice adjustments (See page 3 – 38)
AR_ADJUSTMENTS_REP_ITF	RXi interface table for the Adjustments Register report (See page 3 – 44)
AR_AGING_BUCKETS	Aging bucket lines used in Receivables aging reports (See page 3 – 45)
AR_AGING_BUCKET_LINES_B	An individual aging bucket period that is part of an aging bucket set (See page 3 – 47)

AR_AGING_BUCKET_LINES_TL	Provides multi-lingual support (MLS) for aging bucket periods. MLS enables you to store and print data that you define in multiple languages. (See page 3 – 49)
AR_APPROVAL_ACTION_HISTORY	Approval and change history for invoice adjustments (See page 3 – 50)
AR_APPROVAL_USER_LIMITS	User adjustment approval limits (See page 3 – 52)
AR_APP_RULES	Application Rules (See page 3 – 54)
AR_APP_RULE_DETAILS	Detailed information about individual application rules (See page 3 – 56)
AR_APP_RULE_SETS	Application Rule Sets (See page 3 – 58)
AR_ARCHIVE_CONTROL	Historical archive and purge information (See page 3 – 60)
AR_ARCHIVE_CONTROL_DETAIL	Detailed archive and purge information (See page 3 – 61)
AR_ARCHIVE_DETAIL	Line and distribution-level archive information (See page 3 – 63)
AR_ARCHIVE_HEADER	Header-level archive information (See page 3 – 67)
AR_ARCHIVE_PURGE_INTERIM	Interim table used by the Archive and Purge program (See page 3 – 71)
AR_ARCHIVE_PURGE_LOG	Log information generated during the Archive and Purge process (See page 3 – 72)
AR_AUDIT_DATA	Temporary table used in the rollforward process (See page 3 – 73)
AR_AUTOCASH_HIERARCHIES	AutoCash Rule Sets information (See page 3 – 74)
AR_AUTOCASH_RULES	Application method for each rule in an AutoCash Rule Set (See page 3 – 76)
AR_AUTOREC_EXCEPTIONS	Temporary table used to store exceptions found by Automatic Receipts and its related programs (See page 3 – 78)
AR_BATCHES_ALL	Receipt batch information (See page 3 – 80)
AR_BATCH_SOURCES_ALL	Accounting, bank account, and numbering information for a batch (See page 3 – 84)

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

AR_BR_FMT_TMP	Temporary table used to format and build Bills Receivable reports. (See page 3 – 86)
AR_BR_STAMP_VALUES_ALL	Bills Receivable–specific table that contain stamp information (See page 3 – 87)
AR_BR_STATUS_REP_ITF	RXi report interface table for the Bills Receivable by Status report (See page 3 – 89)
AR_BR_STATUS_SUM_ITF	RXi report interface table for the Bills Receivable by Status report (See page 3 – 92)
AR_BR_TRX_BATCH_RPT	Report table for the Automatic Transaction Batch report (See page 3 – 93)
AR_CALL_ACTIONS	Customer call actions (See page 3 – 95)
AR_CASH_BASIS_DISTS_ALL	Distribution of payments over revenue accounts, used in Cash Basis Accounting (See page 3 – 97)
AR_CASH_RECEIPTS_ALL	Detailed receipt information (See page 3 – 99)
AR_CASH_RECEIPT_HISTORY_ALL	History of actions and status changes in the life cycle of a receipt (See page 3 – 107)
AR_COLIND	Temporary table used by the Oracle Business Intelligence System (OBIS) (See page 3 – 113)
AR_COLLECTION_INDICATORS_ALL	Collection Indicators for a closed period, used by the Collection Indicators report (See page 3 – 114)
AR_COLLECTORS	Information about collectors (See page 3 – 116)
AR_CONC_PROCESS_REQUESTS	Currently running or terminated concurrent requests (See page 3 – 118)
AR_CONC_REQUEST_MESSAGES	Untranslated messages for server PL/SQL error and log reporting (See page 3 – 119)
AR_CONS_INV_ALL	Information about a consolidated billing invoice (See page 3 – 120)
AR_CONS_INV_TRX_ALL	Transactions included on a consolidated billing invoice (See page 3 – 122)
AR_CONS_INV_TRX_LINES_ALL	Transaction lines included on a consolidated billing invoice (See page 3 – 123)
AR_CORRESPONDENCES_ALL	Dunning letters sent to a customer (See page 3 – 124)

**Oracle Proprietary, Confidential Information—Use Restricted by Contract**

AR_CORR_PAY_SCHED_ALL	Intersection table to show invoices referenced in a dunning letter (See page 3 – 126)
AR_CREDIT_HISTORIES	History of changes to a customer’s credit profile (See page 3 – 127)
AR_CREDIT_MEMO_AMOUNTS	GL dates for credit memos that use invoicing rules to back out revenue (See page 3 – 129)
AR_CUSTOMER_ALT_NAMES	Alternate customer names for AutoLockbox name matching (See page 3 – 130)
AR_CUSTOMER_BALANCE_ITF	Customers selected for the Customer Open Balance Letter report (See page 3 – 131)
AR_CUSTOMER_CALLS_ALL	Customer call information (See page 3 – 132)
AR_CUSTOMER_CALL_TOPICS_ALL	Topic of a customer call (See page 3 – 134)
AR_DISPUTE_HISTORY	A history of invoice disputes for each payment schedule (See page 3 – 137)
AR_DISTRIBUTIONS_ALL	Accounting records for receipts (See page 3 – 138)
AR_DISTRIBUTION_SETS_ALL	Groups together a set of distribution lines (See page 3 – 142)
AR_DISTRIBUTION_SET_LINES_ALL	The percentage and account for each line in a distribution set (See page 3 – 143)
AR_DOC_SEQUENCE_AUDIT	A record for every document number generated (See page 3 – 144)
AR_DUNNING_LETTERS_B	Information about dunning letters (See page 3 – 145)
AR_DUNNING_LETTERS_CUSTOM_TL	Provides multi-lingual support (MLS) for custom dunning letters (See page 3 – 147)
AR_DUNNING_LETTERS_TL	Provides multi-lingual support (MLS) for standard dunning letters (See page 3 – 148)
AR_DUNNING_LETTER_SETS	Sequence in which dunning letters are sent (See page 3 – 149)
AR_DUNNING_LETTER_SET_LINES	Individual lines within a dunning letter set (See page 3 – 152)
AR_INTERIM_CASH_RCPT_LINES_ALL	Temporary table used to store QuickCash payment applications (See page 3 – 154)

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

AR_INTERIM_CASH_RECEIPTS_ALL	QuickCash payments processed by the PostBatch program (See page 3 – 157)
AR_INTERIM_POSTING	Used for posting when Cash Basis accounting is used (See page 3 – 161)
AR_JOURNAL_INTERIM_ALL	Temporary table used by the Journal Entries report (See page 3 – 208)
AR_LOCATION_ACCOUNTS_ALL	Stores the tax accounting information (See page 3 – 212)
AR_LOCATION_COMBINATIONS	Defines each distinct tax authority (See page 3 – 214)
AR_LOCATION_RATES	Sales tax rates for each tax authority (See page 3 – 217)
AR_LOCATION_VALUES	Defines the location and description for each of the value sets used in the Sales Tax Location flexfield (See page 3 – 221)
AR_LOCKBOXES_ALL	Lockbox details used by the AutoLockbox program (See page 3 – 224)
AR_MC_ADJUSTMENTS	Currency-related information about invoice adjustments for each reporting set of books (See page 3 – 226)
AR_MC_BATCHES	Currency-related information about receipt batches for each reporting set of books (See page 3 – 227)
AR_MC_CASH_BASIS_DISTS_ALL	Distribution of payments over revenue accounts, used in Cash Basis Accounting for MRC (See page 3 – 228)
AR_MC_CASH_RECEIPTS	Currency-related information about receipts for each reporting set of books (See page 3 – 230)
AR_MC_CASH_RECEIPT_HIST	Currency-related information about each step in the life cycle of a receipt for each reporting set of books (See page 3 – 231)
AR_MC_DISTRIBUTIONS_ALL	Currency-related information about distributions generated by the different steps in the life cycle of a cash receipt (See page 3 – 233)
AR_MC_MISC_CASH_DISTS	Currency and accounting information about miscellaneous cash applications for each reporting set of books (See page 3 – 235)

AR_MC_PAYMENT_SCHEDULES	Currency-related information about all transactions except adjustments and miscellaneous cash receipts (See page 3 – 236)
AR_MC_RATE_ADJUSTMENTS	Currency-related information about exchange rate adjustments for each reporting set of books (See page 3 – 237)
AR_MC_RECEIVABLE_APPS	Cash and credit memo applications for each reporting set of books (See page 3 – 238)
AR_MC_TRANSACTION_HISTORY	Stores posting-related information about transaction history lines for each reporting set of books associated with the parent record. (See page 3 – 240)
AR_MEMO_LINES_ALL_B	Standard memo lines for debit memos, on-account credits, debit memo reversals, and chargebacks (See page 3 – 241)
AR_MEMO_LINES_ALL_TL	Provides multilingual support (MLS) for standard memo lines (See page 3 – 244)
AR_MISC_CASH_DISTRIBUTIONS_ALL	All accounting entries for miscellaneous cash applications (See page 3 – 245)
AR_NOTES	Memopad information for customer calls (See page 3 – 248)
AR_PAYMENTS_INTERFACE_ALL	Imported Lockbox information that was not validated (See page 3 – 249)
AR_PAYMENT_SCHEDULES_ALL	All transactions except adjustments and miscellaneous cash receipts (See page 3 – 259)
AR_PERIODS	Information about accounting periods (See page 3 – 268)
AR_PERIOD_TYPES	Information about accounting period types (See page 3 – 269)
AR_POSTING_CONTROL	Details of each General Ledger Interface submission (See page 3 – 270)
AR_POSTING_REPORT_INTERIM	Temporary table used by the Posting Execution report (See page 3 – 273)
AR_PURGE_OE_EXCEPTIONS	Interim table used by the Archive and Purge process to store identifiers for transactions that cannot be purged (See page 3 – 274)

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

AR_PURGE_REC_AUX	Interim table used by the Archive and Purge process to store identifiers for selected receipts (See page 3 – 275)
AR_PURGE_TRX_AUX	Interim table used by the Archive and Purge program to store identifiers for selected transactions (See page 3 – 276)
AR_RATE_ADJUSTMENTS_ALL	Information about adjustments made to the exchange rates of foreign currency receipts (See page 3 – 277)
AR_RECEIPTS_REP_ITF	Report Exchange interface table for the Receivables Receipts reports (See page 3 – 280)
AR_RECEIPT_CLASSES	Information about receipt classes (See page 3 – 283)
AR_RECEIPT_METHODS	Information about payment methods (See page 3 – 286)
AR_RECEIPT_METHOD_ACCOUNTS_ALL	Account information for accounts used by payment methods (See page 3 – 290)
AR_RECEIVABLES_TRX_ALL	Accounting information for Receivables activities (See page 3 – 295)
AR_RECEIVABLE_APPLICATIONS_ALL	Accounting information for cash and credit memo applications (See page 3 – 298)
AR_REVENUE_ADJUSTMENTS_ALL	Stores information about specific revenue adjustments (See page 3 – 308)
AR_SALES_TAX	Sales tax information for each tax authority defined in Oracle Receivables (See page 3 – 311)
AR_SALES_TAX_REP_ITF	Report Exchange interface table for the US Sales Tax report (See page 3 – 314)
AR_SELECTION_CRITERIA	Stores the selection criteria on a entity. (See page 3 – 317)
AR_STANDARD_TEXT_B	Standard statement messages (See page 3 – 318)
AR_STANDARD_TEXT_TL	Multilingual support (MLS) for standard text messages that you define for statements (See page 3 – 320)
AR_STATEMENTS_HISTORY_ALL	The history of every customer statement that you generate (See page 3 – 321)
AR_STATEMENT_CYCLES	Information about statement cycles (See page 3 – 323)
AR_STATEMENT_CYCLE_DATES_ALL	Dates within a cycle for sending customer statements (See page 3 – 325)

AR_STATEMENT_CYCLE_INTERVALS	Statement cycle intervals (See page 3 – 327)
AR_STATEMENT_HEADERS	Interim table of statement header information (See page 3 – 328)
AR_STATEMENT_LINE_CLUSTERS	Interim table of transaction lines that appear on a statement (See page 3 – 331)
AR_SYSTEM_PARAMETERS_ALL	Oracle Receivables system options (See page 3 – 333)
AR_TAX_CONDITIONS_ALL	Tax Condition Sets (See page 3 – 340)
AR_TAX_CONDITION_ACTIONS_ALL	Actions performed by Tax Condition Sets (See page 3 – 343)
AR_TAX_CONDITION_LINES_ALL	Tax Condition Lines (See page 3 – 346)
AR_TAX_EXTRACT_DCL_ITF	Reporting and legal entities selected by the Tax Reporting Ledger Tax Extract program (See page 3 – 349)
AR_TAX_EXTRACT_MATRIX_ITF	Stores the details of matrix columns for the interface table of the Tax Reporting Ledger (See page 3 – 352)
AR_TAX_EXTRACT_SUB_ITF	Tax Extract interface table (See page 3 – 354)
AR_TAX_GROUP_CODES_ALL	Tax codes within a tax group (See page 3 – 360)
AR_TAX_INTERFACE	Sales tax rates import table (See page 3 – 363)
AR_TA_ASGN_TO_INT_ALL	Interface table that stores details about all salespersons and collectors. Can be used by external deduction management systems (See page 3 – 367)
AR_TA_CASHAPP_OB_ALL	Stores the current open balance of all transactions processed by the Cash Engine for a transmission (See page 3 – 369)
AR_TA_CR_AGEN_INF_ALL	Stores credit information coming from a credit agency for customer–location combination (See page 3 – 370)
AR_TA_CUST_HIER_CHILD	Stores information about child customers and the mapping to parent customers. Part of a parent–child hierarchy definition between customers (See page 3 – 372)
AR_TA_CUST_HIER_PARNT	Stores information about parent customers that belong to parent–child hierarchies between customers (See page 3 – 373)
AR_TA_CUST_INT_ALL	Interface table that stores details about all customers; can be used by external Deduction Management Systems. (See page 3 – 374)

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

AR_TA_CUST_TRXSTR_ALL	Stores the link between original deductions and split or merged deductions (See page 3 – 376)
AR_TA_DEDN_ASSGNS_ALL	Stores assignment history information for deduction transactions (See page 3 – 378)
AR_TA_DEDN_INT_ALL	Interface table that stores deductions being moved between Trade Accounting and external Deduction Management System (See page 3 – 380)
AR_TA_DEDN_RELATE_ALL	Stores the relationships between deductions moved from an external Deduction Management System and new transaction created in Trade Accounting (See page 3 – 383)
AR_TA_LEGACY_CUST_INT	Contains details of customers, including Retail Market Areas, defined in legacy systems (See page 3 – 384)
AR_TA_LEGACY_STAT_INT	Contains promotion statuses defined in the legacy system (See page 3 – 385)
AR_TA_PAYMNT_HIST_ALL	Stores payment history information for customer–location combination for each period (See page 3 – 386)
AR_TA_PROF_ASSGNT_ALL	Stores the mapping of receipt profiles with the key flexfield (See page 3 – 388)
AR_TA_PROMOTIONS_ALL	Stores data about promotions (See page 3 – 390)
AR_TA_PROMOTIONS_INT	Interface table that contains imported promotion data that was not validated or transferred to destination tables (See page 3 – 392)
AR_TA_PROM_CUST_ALL	Stores legacy customers, for imported promotion data along with corresponding Oracle customers (See page 3 – 393)
AR_TA_PROM_CUST_MAP	Contains mapping of the customers defined in the legacy system with those defined in Oracle Financials (See page 3 – 395)
AR_TA_PROM_LINES_INT	Interface table that contains imported promotion details about products, payments (allowances), or customers, that were not validated or transferred to destination tables (See page 3 – 397)
AR_TA_PROM_PAYMNT_ALL	Stores payment allowance details for promotions (See page 3 – 398)

AR_TA_PROM_PAYMNT_TYP	Defines the type of allowance for promotions (See page 3 – 400)
AR_TA_PROM_PRODS_ALL	Stores product details for promotions (See page 3 – 401)
AR_TA_PROM_STATUS_MAP	Contains mapping of promotion statuses defined in the legacy system with those defined in Oracle Financials (See page 3 – 402)
AR_TA_RECON_INFO_ALL	Temporary table used by the AutoReconciliation report (See page 3 – 403)
AR_TA_RECV_TRXSET_ALL	Stores association of Transaction Sets with Receivable accounts (See page 3 – 405)
AR_TA_REMIT_HIST_ALL	Contains the application details of all Receipts and Receipt lines processed by the Cash Engine (See page 3 – 407)
AR_TA_REMIT_PROF_ALL	Stores setup information about customer remittance processing (See page 3 – 414)
AR_TA_RISK_COMENT_ALL	Comments associated with customer–location combination (See page 3 – 417)
AR_TA_RULES_ALL	Details of all rules that are used by the Cash Engine to match receipt lines to transactions in the database (See page 3 – 419)
AR_TA_RULE_OUTPUT	Trade Accounting rule output (See page 3 – 421)
AR_TA_RULE_SETS_ALL	Details of the rule sets defined in Trade Accounting (See page 3 – 422)
AR_TA_RULE_SET_LN_ALL	Details of the transaction types and event types contained in a transaction set (See page 3 – 424)
AR_TA_TRX_SETS_ALL	Details of the transaction sets defined in Trade Accounting (See page 3 – 426)
AR_TA_TRX_SET_LN_ALL	Details of the transaction types and event types contained in a transaction set (See page 3 – 428)
AR_TA_TRX_TO_CREATE	Information about the transactions that the Cash Engine needs to create (See page 3 – 430)
AR_TA_TRX_TYP_INT_ALL	Interface table that stores details about all transaction types; can be used by external Deduction Management Systems. (See page 3 – 432)

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

AR_TA_VERSIONS	Trade Accounting versions (See page 3 – 434)
AR_TRANSACTIONS_REP_ITF	Report Exchange interface table for the Receivables Transactions reports (See page 3 – 435)
AR_TRANSACTION_HISTORY_ALL	Life cycle of a transaction (See page 3 – 437)
AR_TRANSMISSIONS_ALL	Lockbox transmission information (See page 3 – 440)
AR_TRANSMISSION_FORMATS	Lockbox transmission formats (See page 3 – 442)
AR_TRANS_FIELD_FORMATS	Format of each field in a Lockbox transmission format (See page 3 – 444)
AR_TRANS_RECORD_FORMATS	Format of a record within a Lockbox transmission format (See page 3 – 446)
AR_VAT_TAX_ALL_B	Tax codes defined in the Tax Codes and Rates window (See page 3 – 448)
AR_VAT_TAX_ALL_TL	Multi-lingual support (MLS) for each tax code that you define (See page 3 – 452)
BOM_OPERATION_SEQUENCES	Routing operations (See page 3 – 457)
FND_APPLICATION	Applications registered with Oracle Application Object Library
FND_CONCURRENT_PROGRAMS	Concurrent programs
FND_CONCURRENT_REQUESTS	Concurrent requests information
FND_CURRENCIES	Currencies enabled for use at your site (See page 3 – 461)
FND_DESCRIPTIVE_FLEXS	Descriptive flexfields registration information
FND_DESCR_FLEX_COLUMN_USAGES	Correspondences between application table columns and descriptive flexfield segments
FND_DOCUMENT_SEQUENCES	Document sequences registered with Oracle Application Object Library
FND_DOC_SEQUENCE_ASSIGNMENTS	Assigns a sequence to a document
FND_DOC_SEQUENCE_CATEGORIES	Document category definitions
FND_DUAL	Dummy base table used by a form block that does not have a real base table (for commit purposes) (See page 3 – 464)
FND_FLEX_VALIDATION_TABLES	Flexfield validation tables

**Oracle Proprietary, Confidential Information—Use Restricted by Contract**

FND_FLEX_VALUES	Valid values for flexfield segments
FND_FLEX_VALUE_SETS	Value sets used by both key and descriptive flexfields
FND_FORM	Application forms registered with Oracle Application Object Library
FND_ID_FLEX_SEGMENTS	Key flexfield segments setup information and correspondences between table columns and key flexfield segments
FND_ID_FLEX_STRUCTURES	Key flexfield structure information
FND_LANGUAGES	National dialects
FND_LOOKUP_VALUES	QuickCode values
FND_OBJECT_INSTANCE_SETS	
FND_ORACLE_USERID	ORACLE accounts that contain application data
FND_PRODUCT_DEPENDENCIES	Dependencies of Oracle Applications products installed at your site
FND_PRODUCT_INSTALLATIONS	Oracle Applications products installed at your site
FND_PROFILE_OPTIONS	User profile options
FND_PROFILE_OPTION_VALUES	Values of user profile options defined at different profile levels
FND_SEGMENT_ATTRIBUTE_VALUES	Values of flexfield qualifiers for different segments of key flexfield structures
FND_TERRITORIES	Territories, also known as countries
FND_USER	Application users
GL_APPLICATION_GROUPS	Application product groups that use Oracle General Ledger accounting periods (See page 3 – 465)
GL_BALANCES	Account balances for both detail and summary accounts (See page 3 – 466)
GL_CODE_COMBINATIONS	Account combinations (See page 3 – 468)
GL_DAILY_CONVERSION_TYPES	Foreign currency daily conversion rate types (See page 3 – 473)
GL_INTERFACE	Import journal entry batches (See page 3 – 474)

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

GL_INTERFACE_CONTROL	Journal import execution control (See page 3 – 478)
GL_JE_BATCHES	Journal entry batches (See page 3 – 479)
GL_JE_CATEGORIES_TL	Journal entry categories (See page 3 – 483)
GL_JE_HEADERS	Journal entry headers (See page 3 – 484)
GL_JE_LINES	Journal entry lines (See page 3 – 489)
GL_JE_SOURCES_TL	Journal entry sources (See page 3 – 493)
GL_PERIODS	Calendar period definitions (See page 3 – 495)
GL_PERIOD_STATUSES	Calendar period statuses (See page 3 – 497)
GL_PERIOD_TYPES	Calendar period types (See page 3 – 499)
GL_SETS_OF_BOOKS	Set of books definitions (See page 3 – 500)
GL_TRANSACTION_RATE_EXCEPTIONS	Feeder system journal transaction rate exceptions (See page 3 – 504)
GL_TRANSLATION_RATES	Foreign currency translation rates (See page 3 – 506)
GL_WEIGHTED_AVG_DETAILS	Feeder system journal details calculated using weighted average rates (See page 3 – 508)
HR_ORGANIZATION_INFORMATION	Additional attributes of an organization, dependent on class or organization information type. (See page 3 – 510)
HZ_BILLING_PREFERENCES	Invoicing format (See page 3 – 513)
HZ_CERTIFICATIONS	Certifications given to parties (See page 3 – 515)
HZ_CITIZENSHIP	Person’s claimed nationality (See page 3 – 517)
HZ_CLASS_CATEGORIES	Classification categories for classifying parties and related entities (See page 3 – 519)
HZ_CLASS_CATEGORY_USES	Usage of class categories by owner tables (See page 3 – 520)
HZ_CLASS_CODE_RELATIONS	Relationships between classification codes (See page 3 – 521)
HZ_CODE_ASSIGNMENTS	Intersection table linking industrial classification codes to parties or related entities (See page 3 – 522)
HZ_CONTACT_POINTS	Electronic methods of communicating with parties (See page 3 – 524)

## Public View List

This section lists each public database view that Oracle Receivables uses and provides a brief description of each of those views. These views may be useful for your custom reporting or other data requirements. The page reference is to the detailed view description in Chapter 3.

Oracle Receivables uses the following public views:

<b>View Name</b>	<b><u>Description</u></b>
AR_INVOICE_ADJ_V	Collects detailed adjustment information (See page 3 – 162)
AR_INVOICE_COMMITMENT_INFO_V	Collects information about commitments (See page 3 – 176)
AR_INVOICE_COUNT_TERMS_V	Collects the number of payment dates defined for a transaction (See page 3 – 178)
AR_INVOICE_HEADER_V	Collects invoice header-level information (See page 3 – 179)
AR_INVOICE_INSTALLMENTS_V	Collects invoice installment information (See page 3 – 197)
AR_INVOICE_LINES_V	Collects invoice line item information (See page 3 – 199)
AR_INVOICE_TAX_SUMMARY_V	Collects tax information for transactions (See page 3 – 205)
AR_INVOICE_TOTALS_V	Collects the total amount of charges for a transaction (See page 3 – 207)

## Single Organization View List

Multi-Organization Support is a feature that allows you to implement multiple sets of books within a single installation of Oracle Payables, Oracle Receivables, Oracle Purchasing, and Oracle Order Entry/Shipping. Instead of using multiple installations to provide data security, data is secured by operating unit.

In Release 10.7, we added a column, `ORG_ID`, to each base table that requires "partitioning" by operating unit, including all transaction tables and many reference tables, then renamed these tables to end with the suffix `_ALL`. Then, to take the place of the renamed table, we create a view (named like the Release 10.6 or earlier table) containing a `WHERE` clause that automatically restricts data to a single operating unit. The `WHERE` clause relies upon the value of an Oracle global variable to indicate the current organization.

If you want to retrieve all information, regardless of operating unit, query the `_ALL` table. For example, if you are running a cross-organization report, you probably want to query the `_ALL` table.

However, if you want to report against only a single organization or operating unit, query the corresponding cross-organizational view, using the familiar 10.6-style table name. The view definition will automatically retrieve only data for your current operating unit.

## Multiple Reporting Currencies View List

This section lists each view that Oracle Receivables uses to support the Multiple Reporting Currencies (MRC) feature. These views, under certain circumstances, replace the corresponding transaction tables but retrieve currency-sensitive information expressed in the reporting currency rather than in the functional currency for the associated set of books. That is, when you access a transaction table from the APPS\_MRC schema, an MRC synonym redirects your query to the corresponding MRC view; this MRC view ensures you retrieve currency amounts expressed in the currency associated with the reporting set of books, as indicated by the userenv variable.

If you have not installed Multiple Reporting Currencies, you do not need to use these views. If you do use MRC, standard product forms and reports automatically access data using these views whenever you sign on using a reporting currency responsibility.

**Additional Information:** Multiple Reporting Currencies, *Oracle Applications Installation Manual, Volume 1: Architecture and Concepts*; and *Multiple Reporting Currencies in Oracle Applications*

Oracle Receivables uses the following Multiple Reporting Currencies views:

# Backwards-Compatible View List

In release 11i, version 11.5.1, we modified the customer component of Receivables to support future features. We created new tables, with the prefix HZ, that hold customer data. We moved data from 11 customer tables into these tables, and no longer use the 11 tables. To make the transition smooth and support existing code and customizations, we created new views that reference the same information as the previous 11 customer tables. We created synonyms for these views that have the same name as the now obsolete customer tables. For example, any existing references to RA\_CUSTOMERS will now use the synonym RA\_CUSTOMERS to retrieve data from the new HZ customer tables through the new RA\_HCUSTOMERS view.

The following list shows you these new synonyms and views.

## CHAPTER

# 3

# Detailed Design

**T**his chapter presents a detailed design for implementing Oracle Receivables and Oracle Public Sector Receivables. It contains detailed definitions of tables and views that you may need to reference to write custom reports or use for other data extraction.

---

## Overview of Detailed Design

During Detailed Design, we specify in detail how each applications component should work. We prepare detailed definitions of tables and views.

You can refer to this Detailed Design chapter to gain a detailed understanding of the underlying structure and processing of Oracle Receivables and Oracle Public Sector Receivables that enables you to:

- Convert existing application data
- Integrate your Oracle Receivables application with your other applications systems
- Write custom reports
- Define alerts against Oracle Applications tables
- Create views for decision support queries using query tools
- Configure your Oracle Self-Service Web Applications

---

## Table and View Definitions

The Table and View Definitions section contains a detailed definition of Oracle Receivables applications tables. For each table, it provides information about primary keys, foreign keys, QuickCodes, indexes, triggers, and sequences. It also gives you a detailed description of each column and its characteristics. In addition, it provides the SQL statement that defines each view. Review this section to get a detailed understanding of what tables your Oracle Receivables application contains, and how it uses them to hold and access the information it needs.

---

## Table and View Definitions

This section contains a detailed description of each Oracle Receivables and Oracle Public Sector Receivables table and view that you may need to reference. For each table, it presents detailed information about:

- Primary keys
- Foreign keys
- Column descriptions
- Indexes
- Oracle sequences
- Triggers
- View derivations

Because Oracle does not support customization of Oracle Application Object Library tables, we do not provide you with detailed information about them. Consequently, this section does not document all the FND\_% tables your Oracle Receivables application uses.

The following sections appear in each table or view description:

---

### Foreign Keys

To help you understand the relationships between tables, we list each foreign key contained in a table. For each foreign key in a table, we list the primary key table name (the table to which a foreign key refers), its corresponding primary key columns, and the foreign key columns that refer to those primary key columns.

When the primary key table has a composite primary key, we list each column of the composite key sequentially.

If a table contains two or more distinct foreign keys that refer to the same primary key table, we repeat the primary key table name and list each of the distinct foreign keys separately.

---

### QuickCodes Columns

When a database column contains a QuickCodes value, which we implement using a foreign key to FND\_LOOKUPS, MFG\_LOOKUPS, or to some other lookup table, we list the QuickCodes type (lookup

**Oracle Proprietary, Confidential Information—Use Restricted by Contract**

type) to which the QuickCodes value must belong and a complete list of QuickCodes values and meanings. Some QuickCodes can be defined by you in the application. These values are designated as User-defined.

---

## Column Descriptions

We list the important characteristics of each column in a table or view. These characteristics include whether the column is part of the table's primary key, whether Oracle8i requires a value for this column, and the data type of the column. We also give you a brief description of how your Oracle Receivables application uses the column.

When a column is part of a table's primary key, we append the notation (PK) to the name of that column.

To help you understand which columns your Oracle Receivables application uses and which columns it does not use, we alert you to any unused column. When no module uses a database column, we show one of the following legends in the Description column:

<b>Not currently used</b>	Your Oracle Receivables application does not use this column, although the column might be used in a future release.
<b>No longer used</b>	Your Oracle Receivables application no longer uses this column. AutoInstall installs this column. Subsequent versions of your Oracle Receivables application might not include this column.
<b>No longer installed</b>	Your Oracle Receivables application no longer uses this column. If you <i>upgraded</i> your software from an earlier version, you may still have this column, depending upon whether you chose to delete it during an upgrade process. If you <i>install</i> your Oracle Receivables application, you do not have this column.

### Standard Who Columns

---

Most Oracle Receivables applications tables contain standard columns to support \ Row Who. When your program or SQL\*Plus command selects a row from a table, use these columns to determine who last updated the row. If your program or SQL\*Plus command updates or

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

inserts a row in an interface table, you must populate each of the five standard Who columns:

<b>LAST_UPDATE_DATE</b>	Date when a user last updated this row
<b>LAST_UPDATED_BY</b>	User who last updated this row (foreign key to FND_USER.USER_ID)
<b>CREATION_DATE</b>	Date when this row was created
<b>CREATED_BY</b>	User who created this row (foreign key to FND_USER.USER_ID)
<b>LAST_UPDATE_LOGIN</b>	Operating system login of user who last updated this row (foreign key to FND_LOGINS.LOGIN_ID). You should set this to NULL, or to 0 if NULL is not allowed

Since every table containing Who columns has several foreign keys to the tables FND\_USER and FND\_LOGINS, we do not include the foreign key columns LAST\_UPDATED\_BY, CREATED\_BY, or LAST\_UPDATE\_LOGIN in a table's list of foreign keys.

### **Additional Who Columns for Concurrent Programs**

---

Some Oracle Receivables applications tables also contain several additional Who columns to distinguish between changes a user makes with a form and changes a concurrent program makes. When a concurrent program updates or inserts a row in a table, the concurrent program populates the following additional Who columns:

<b>REQUEST_ID</b>	Concurrent request ID of program that last updated this row (foreign key to FND_CONCURRENT_REQUESTS.REQUEST_ID)
<b>PROGRAM_APPLICATION_ID</b>	Application ID of program that last updated this row (foreign key to FND_APPLICATION.APPLICATION_ID)
<b>PROGRAM_ID</b>	Program ID of program that last updated this row (foreign key to FND_CONCURRENT_PROGRAM.CONCURRENT_PROGRAM_ID)
<b>PROGRAM_UPDATE_DATE</b>	Date when a program last updated this row

Since every table containing these additional Who columns has several foreign keys to the tables FND\_CONCURRENT\_REQUESTS, FND\_APPLICATION, and FND\_CONCURRENT\_PROGRAM, we do not include the foreign key columns REQUEST\_ID, PROGRAM\_APPLICATION\_ID, or PROGRAM\_ID in a table's list of foreign keys.

### **Columns Reserved for Country-Specific Features**

---

Some tables have GLOBAL\_ATTRIBUTE columns that support additional features added to Oracle Receivables to meet statutory requirements and common business practices in your country or region. For details on these columns, refer to the Appendix in *Oracle Financials Global Technical Reference Manual*. To read more about the features that these columns support, look for a User Guide appropriate to your country; for example, see the *Oracle Financials for the Czech Republic User Guide*.

---

## **Indexes**

If an Oracle Receivables applications table uses an Oracle8i index, we list the database columns that comprise that index, in sequential order.

**Note:** The indexes we document in this manual correspond to unique keys we specified during product development and testing. In some cases, we may add additional indexes during the porting process to fine-tune performance on specific platforms; therefore, there may be minor differences between the indexes documented in this book and the indexes for production versions of Oracle Receivables.

---

## **Sequences**

Your Oracle Receivables application uses Oracle8i sequence generators to generate unique integers. If any table column gets its value from an Oracle8i sequence generator, we list the name of the corresponding sequence generator and the name of the column that stores the unique integer.

---

## Database Triggers

If a table has one or more active database triggers, we provide a brief explanation of each database trigger and when the trigger fires.

---

## View Derivation

For each Oracle Receivables applications view you may need to reference, we include important elements from the SQL statement that defines or creates a view. By studying this view definition, you can understand exactly how a view derives its contents.

## AP\_BANK\_ACCOUNTS\_ALL

AP\_BANK\_ACCOUNTS\_ALL contains information about your bank accounts. You need one row for each bank account you define. Each bank account must be affiliated with one bank branch. When you initiate an automatic payment batch, enter a manual check, or create a Quick payment, you can select a bank account that you define in this table.

This table corresponds to the Bank Accounts window.

## AP\_CHECKS\_ALL

AP\_CHECKS\_ALL stores information about payments issued to suppliers or refunds received from suppliers. You need one row for each payment you issue to a supplier or refund received from a supplier. Your Oracle Payables application uses this information to record payments you make to suppliers or refunds you receive from suppliers. Your Oracle Payables application stores the supplier name and bank account name for auditing purposes, in case either one is changed after you create the payment. Your Oracle Payables application stores address information for all payments. If you allow changes to the supplier payment address on manual payments or Quick payments, your Oracle Payables application maintains the new address information in this table. Your Oracle Payables application uses BANK\_ACCOUNT\_NUM, BANK\_NUM, and BANK\_ACCOUNT\_TYPE for the supplier's bank information when you use the Electronic payment method. Your Oracle Payables application stores a dummy value for CHECK\_STOCK\_ID for refunds, thus, CHECK\_STOCK\_ID should not be treated as a foreign key to AP\_CHECK\_STOCKS\_ALL in the case of refunds.

# Database Triggers

Trigger Name : AP\_MRC\_CHECKS\_BIUD  
 Trigger Time : BEFORE  
 Trigger Level : ROW  
 Trigger Event : INSERT, UPDATE, DELETE

This MRC trigger exists only when you install the Multiple Reporting Currencies feature. It is executed when you perform an insert, update, or delete statement on the table AP\_CHECKS\_ALL. For each record being inserted/updated/deleted in AP\_CHECKS\_ALL, this trigger inserts/updates/deletes corresponding reporting currency records in the MRC subtable, AP\_MC\_CHECKS. In addition, this trigger also populates the MRC VARCHAR2 columns in AP\_CHECKS\_ALL.

Trigger Name : AX\_AP\_CHECKS\_BR11  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT

This trigger captures information needed to create subledger accounting events when Oracle Payables and the Set of Books used is defined as a subledger in the Global Accounting Engine application. This trigger may insert/update/delete rows in the AX\_DOCUMENT\_STATUSES and AX\_EVENTS tables. This trigger captures accounting events for Oracle Payables payment transactions. It fires right before a payment is created.

Trigger Name : AX\_AP\_CHECKS\_ARU1  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : UPDATE

This trigger captures information needed to create subledger accounting events when Oracle Payables and the Set of Books used is defined as a subledger in the Global Accounting Engine application. This trigger may insert/update/delete rows in the AX\_DOCUMENT\_STATUSES and AX\_EVENTS tables. This trigger captures accounting events for Oracle Payables payment transactions. It fires after a row is updated.

Trigger Name : AX\_AP\_CHECKS\_ARU2  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : UPDATE

This trigger captures information needed to create subledger accounting events when Oracle Payables and the Set of Books used is defined as a subledger in the Global Accounting Engine application. This trigger may insert/update/delete rows in the AX\_DOCUMENT\_STATUSES and AX\_EVENTS tables. This trigger captures accounting events for Oracle Payables payment transactions. It fires after a not null document sequence is assigned to the payment.

## AP\_CHECK\_FORMATS

AP\_CHECK\_FORMATS contains records for payment formats you can use to create payment documents. You need one row for each format you use to create payments (for example, checks) to suppliers. The table AP\_PAYMENT\_PROGRAMS stores payment program names that you can use to define payment formats. Each row in this table references AP\_PAYMENT\_PROGRAMS either two or three times, once in CREATE\_PAYMENTS\_PROGRAM\_ID, once in CONFIRM\_PAYMENTS\_PROGRAM\_ID, and once in REMITTANCE\_ADVICE\_PROGRAM\_ID for formats with a separate remittance advice program.

This table corresponds to the Payment Formats window.

## AP\_CHECK\_STOCKS\_ALL

AP\_CHECK\_STOCKS\_ALL stores information about payment documents you defined for bank accounts. You need one row for each payment document you use to create payments for a supplier. Each record in this table must be associated with a bank account. Each bank account corresponds with zero or more rows in this table. When you initiate a payment batch, record a manual payment, or create a Quick payment, you can select a payment document that you defined in this table. For a payment document you use to create automatic payments, DISBURSEMENT\_TYPE\_LOOKUP\_CODE must be 'COMPUTER GENERATED' or 'COMBINED.' For manual payments, it must be 'RECORDED' or 'COMBINED.'

Your Oracle Payables application updates the LAST\_DOCUMENT\_NUM when you create payments in an automatic payment batch, enter a manual payment, or create a Quick payment.

This table corresponds to the Payment Documents window.

## AP\_PAYMENT\_PROGRAMS

AP\_PAYMENT\_PROGRAMS stores information about payment programs that you use to define payment formats. You need one row for each payment program you use. Your Oracle Payables application uses this information to use the proper payment programs when you use a payment format to create payments. Values in PROGRAM\_NAME correspond to names of Pro\*C, SQL\*Plus, or Oracle Reports programs. Rows in AP\_CHECK\_FORMATS reference rows in this table. This table corresponds to the Automatic Payment Programs window. This table has no foreign keys.

## AP\_TAX\_CODES\_ALL

AP\_TAX\_CODES\_ALL contains information about the tax codes you define. You need one row for each tax code you want to use when entering invoices. When you enter invoices, you can use a list of values to select a tax code defined in this table. Your Oracle Payables application also uses TAX\_RATE to calculate use tax when you enter a taxable amount for an invoice.

This table corresponds to the Tax Codes window.

## AR\_ACTION\_NOTIFICATIONS

The AR\_ACTION\_NOTIFICATIONS table identifies which employees to notify about a particular customer call action.

Oracle Receivables stores the rest of the call action information in the AR\_CALL\_ACTIONS and the AR\_NOTES tables. The AR\_CALL\_ACTIONS table stores your call actions, and the AR\_NOTES table stores memo pad information. Oracle Receivables uses information from both tables to display, in the Call Actions report, the actions to take in response to a customer call.

The primary key for this table is ACTION\_NOTIFICATION\_ID.

## AR\_ADJUSTMENTS\_ALL

The AR\_ADJUSTMENT\_ALL table stores information about your invoice adjustments. Each row includes general information about the adjustment that you make, such as activity name, amount, accounting information, reason, and type of adjustment. You need one row for each adjustment that you make to an invoice.

Oracle Receivables uses the information in the AR\_ADJUSTMENT\_ALL table to update the AMOUNT\_ADJUSTED and AMOUNT\_DUE\_REMAINING columns in the AR\_PAYMENT\_SCHEDULES\_ALL table.

If you create an adjustment through the Receipts window, the ASSOCIATED\_CASH\_RECEIPT\_ID column in the AR\_PAYMENT\_SCHEDULES\_ALL table stores the cash receipt ID of the receipt that you entered when you created the adjustment to your invoice, debit memo, or chargeback.

The primary key for this table is ADJUSTMENT\_ID.

## Database Triggers

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

Trigger Name : AX\_AR\_ADJUSTMENTS\_BRD1  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : DELETE

This trigger captures information that is needed to create subledger accounting events when Oracle Receivables and the Set of Books used is defined as a subledger in the Global Accounting Engine. This trigger deletes accounting events related to Oracle Receivables transaction adjustments and fires before an unposted and approved adjustment is deleted. It deletes the untranslated event from the AX\_EVENTS table.

Trigger Name : AR\_MRC\_ADJUSTMENTS\_BIUD  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT, UPDATE, DELETE

This MRC trigger runs only when you install the Multiple Reporting Currencies feature, and executes when you perform an insert, update, or delete statement on the AR\_ADJUSTMENTS\_ALL table. For each record that is inserted, updated, or deleted in the AR\_ADJUSTMENTS\_ALL table, this trigger inserts, updates, or deletes corresponding reporting currency records in the AR\_MC\_ADJUSTMENTS MRC subtable. This trigger also populates the MRC VARCHAR2 columns in the AR\_ADJUSTMENTS\_ALL table.

Trigger Name : JL\_BR\_AR\_OCC\_DOCS\_WRT\_N\_ABTMT2  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : INSERT

This trigger inserts a new record in the JL\_BR\_AR\_OCCURRENCE\_DOCS\_ALL table after a negative adjustment is created and the payment schedule is in the bank for collection. This trigger fires after insert in the AR\_ADJUSTMENTS\_ALL table and is active only if Oracle Financials for the Americas is used.

Trigger Name : AX\_AR\_ADJUSTMENTS\_ARIU1  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT, UPDATE

This trigger captures information that is needed to create subledger accounting events when the Set of Books used is defined as a Global Accounting Engine Set of Books for Oracle Receivables. This trigger captures accounting events that are related to Oracle Receivables transaction adjustments and fires before an invoice adjustment is approved and not yet posted. This trigger creates adjustment accounting events in the AX\_EVENTS table.

Trigger Name : AX\_AR\_ADJUSTMENTS\_ARU1  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : UPDATE

This trigger captures information that is needed to create subledger accounting events when the Set of Books used is defined as a Global Accounting Engine Set of Books in Oracle Receivables. This trigger updates related accounting events of an Oracle Receivables transaction adjustment when a document sequence is assigned to the adjustment. It fires after a document sequence is assigned to an existing adjustment.

## AR\_ADJUSTMENTS\_REP\_ITF

The AR\_ADJUSTMENTS\_REP\_ITF table stores invoice adjustment information that Report eXchange Designer (RXi) reports use. For example, when you run the Adjustment Register, an RXi report which lets you specify report content and layout, information from this table is printed.

## AR\_AGING\_BUCKETS

The AR\_AGING\_BUCKETS table stores information about your aging buckets, used to group and report on open receivables transactions. Each row includes information such as the name, type, and status of your aging bucket. For example, you can define an aging bucket called "Old Past Due Items" that includes an aging bucket line for invoices that are 180 to 270 days past due.

You need one row for each aging bucket that you define. Each row has at least one line defined in the AR\_AGING\_BUCKET\_LINES\_B table. Oracle Receivables uses the information in the AR\_AGING\_BUCKETS and AR\_AGING\_BUCKET\_LINES\_B tables for your aging reports.

The primary key for this table is AGING\_BUCKET\_ID.

## AR\_AGING\_BUCKET\_LINES\_B

The AR\_AGING\_BUCKET\_LINES\_B table stores information about your aging bucket periods. Each line refers to a specific aging period that are used to group transactions. For example, if you defined an aging bucket for invoices that are 1 to 30 days past due, this table stores 1 in the DAYS\_START column and 30 in the DAYS\_TO column.

You need one row for each period range. Oracle Receivables uses the information in the AR\_AGING\_BUCKET\_LINES\_B and AR\_AGING\_BUCKETS tables for your aging reports.

The primary key for this table is AGING\_BUCKET\_LINE\_ID.

## AR\_AGING\_BUCKET\_LINES\_TL

The AR\_AGING\_BUCKET\_LINES\_TL table provides multilingual support (MLS) for aging buckets that you define in Oracle Receivables. MLS lets you store and print information that you define in multiple languages. For example, if you define an aging bucket in Spanish, the LANGUAGE column stores the code for Spanish.

The primary keys for this table are AGING\_BUCKET\_LINE\_ID and LANGUAGE.

## AR\_APPROVAL\_ACTION\_HISTORY

The AR\_APPROVAL\_ACTION\_HISTORY table stores information about each step in the lifecycle of an adjustment. A record is created in this table each time that you change the status of a pending adjustment. For example, if you reject a credit memo today because you need more information, the ACTION\_NAME column stores Rejected, the ACTION\_DATE column stores today's date, and the COMMENTS column stores the comments that you entered, such as "Need more information."

The primary key for this table is APPROVAL\_ACTION\_HISTORY\_ID.

## AR\_APPROVAL\_USER\_LIMITS

The AR\_APPROVAL\_USER\_LIMITS table stores information about each approval limit, for each currency, that is assigned to a user to create adjustments and to approve credit memo requests. Oracle Receivables uses this information when Receivables users enter adjustments and when approvers defined in the Credit Memo Request workflow respond to credit memo requests.

The primary key for this table is USER\_ID.

## AR\_APP\_RULES

The AR\_APP\_RULES table stores information about individual application rules within an application rule set. Application rules determine how Oracle Receivables applies partial payments to open debit items and how discounts affect the balance due for each type of associated charges, such as line, tax, freight, and finance charges. You can assign application rule sets at the transaction type and system options levels.

The primary key for this table is RULE\_ID.

## AR\_APP\_RULE\_DETAILS

The AR\_APP\_RULE\_DETAILS table stores detailed information about an application rule, including amounts rounding, tax treatment, and line type. For example, if you define an application rule to prorate partial payments across all line types, a record in this table would have Line in the LINE\_TYPE column and Prorate in the TAX\_TREATMENT column.

The primary key for this table is RULE\_DETAIL\_ID.

### Column Descriptions

## AR\_APP\_RULE\_SETS

The AR\_APP\_RULE\_SETS table stores information about application rule sets. The RULE\_SET\_SOURCE column holds the compiled code that is executed at run time.

The primary key for this table is RULE\_SET\_ID.

### Column Descriptions

## AR\_ARCHIVE\_CONTROL

The AR\_ARCHIVE\_CONTROL table stores historical data for Archive and Purge submissions. Each Archive and Purge process inserts a record into this table. For example, if you run Archive–Preview, Oracle Receivables creates one record for each control module, selection and validation process, archive, and so on.

All records that are associated with a particular run have the same value in the ARCHIVE\_ID column and are distinguished by the REQUEST\_ID column. As each step in the archive process begins, Receivables inserts a record and updates the STATUS column with R for running. When the step is finished, Receivables updates the STATUS column with C for complete, and inserts a new record with a status of R for the next step of the process.

*Column Descriptions*

## AR\_ARCHIVE\_CONTROL\_DETAIL

The AR\_ARCHIVE\_CONTROL\_DETAIL table stores historical, statistical data that is created by running the Archive and Purge program. Oracle Receivables creates one record in this table for each General Ledger period that is archived during the archive process. This table stores the transaction type, record count, and amount and then groups the count and amount by transaction type. Receivables uses the information in this table to generate the Archive Summary report.

## AR\_ARCHIVE\_DETAIL

The AR\_ARCHIVE\_DETAIL table contains information about transaction lines as well as distribution information. This table contains records about credit memo and receipt applications for a header level archive. Most of this information, however, is archived for header and line as well as header, line, and distribution archives. In addition, this information is only archived for a header, line, and distribution level archive:

- Selected distribution-related columns from the line records.
- One additional record for each account distribution in RA\_CUST\_TRX\_LINE\_GL\_DIST and AR\_MISC\_CASH\_DISTRIBUTIONS.

## AR\_ARCHIVE\_HEADER

The AR\_ARCHIVE\_HEADER table stores header-level information for transactions that are selected by the Archive and Purge program. Transactions can include invoices, receipts, credit or debit memos, adjustments, guarantees, deposits, chargebacks, and on-account credits. This header-level information is archived for all Archive-Levels and is used for the Archive Detail report. This table stores three types of records:

- TRX – Transactions
- CR – Receipts
- ADJ – Adjustments

If one of these types is not referenced, the column is null for records of that type.

# AR\_ARCHIVE\_PURGE\_INTERIM

The AR\_ARCHIVE\_PURGE\_INTERIM table is populated by the validation process and stores the identification numbers of any transactions that qualify. The purge program uses these numbers to identify transactions to purge, but does not revalidate the identification numbers.

Column Descriptions

Name	Null?	Type	Description
TRX_ID	NULL	NUMBER	Transaction identifier
RELATED_ID	NULL	NUMBER	Related transaction identifier (either another transaction or receipt)

Indexes

Index Name	Index Type	Sequence	Column Name

AR_ARCHIVE_PURGE_INTERIM_N2	NOT UNIQUE	1	RELATED_ID

# AR\_ARCHIVE\_PURGE\_LOG

The AR\_ARCHIVE\_PURGE\_LOG table stores any error messages that were generated during the Archive and Purge processing cycle. You can review this table to identify when the error occurred.

Column Descriptions

Name	Null?	Type	Description
MESSAGE	NULL	VARCHAR2(240)	Column for log message
TIME	NULL	DATE	Time stamp for message

# AR\_AUDIT\_DATA

The AR\_AUDIT\_DATA table stores rows that are used by the rollforward process. The rollforward process is the process of taking the beginning balance of a period and then accounting for the transactions within that period by attempting to equate the beginning balance with the ending balance for the period.

## AR\_AUTOCASH\_HIERARCHIES

The AR\_AUTOCASH\_HIERARCHIES table stores information about each AutoCash rule set that you define. Each row contains information for a specific AutoCash rule set, including name, description, and the AutoCash rules that you assign to this rule set.

AutoCash rule sets determine how Oracle Receivables calculates a customer's open balance and whether Oracle Receivables applies partial payments when using the Apply to the Oldest Invoice First payment application method. You define AutoCash Rules in the AR\_AUTOCASH\_RULES table.

The primary key for this table is AUTOCASH\_HIERARCHY\_ID.

# AR\_BATCHES\_ALL

The AR\_BATCHES\_ALL table stores batch source information about each receipt batch that you create in Oracle Receivables. Each row includes specific batch information, such as batch source, status, batch type, control count, and control amount.

The BATCH\_APPLIED\_STATUS column stores the status of your QuickCash batches in relation to running PostBatch. Other status values are used for remittance batches. For rows that were not processed by the Post QuickCash program, valid values are IN\_PROCESS, PROCESSED, and POSTBATCH\_WAITING.

The TYPE column has one of these values:

- MANUAL – Manually created batches
- CREATION – Batches that contain automatic receipts
- REMITTANCE – Remittance batches
- CLEARANCE – Clearance batches
- BR\_REMITTANCE – Bills Receivable remittance batches

The primary key for this table is BATCH\_ID.

### Database Triggers

Trigger Name : AR\_MRC\_BATCHES\_BIUD  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT, UPDATE, DELETE

The AR\_MRC\_BATCHES\_BIUD trigger is a MRC trigger that exists only when you install the Multiple Reporting Currencies feature and executes when you perform an insert, update, or delete statement on the AR\_BATCHES\_ALL table. For each record that is inserted, updated, or deleted in the AR\_BATCHES\_ALL table, this trigger inserts, updates, or deletes corresponding reporting currency records in the AR\_MC\_BATCHES MRC subtable.

## AR\_BATCH\_SOURCES\_ALL

The AR\_BATCH\_SOURCES\_ALL table stores information about your receipt batch sources. Receipt batch sources provide default values for the receipt class, bank account, and payment method for each receipt in a receipt batch. Oracle Receivables also uses this information to automatically number your batch sources.

The primary key for this table is BATCH\_SOURCE\_ID, which identifies the batch source that created the row.

## AR\_BR\_FMT\_TMP

The AR\_BR\_FMT\_TMP table is temporary table that Oracle Receivables uses to format and build the Spanish Bills Receivable reports before the reports are printed. The Spanish Bills Receivable reports are:

- Spanish Bills Receivable CSB32 Remittance Format report
- Spanish Bills Receivable CSB58 Remittance Format report
- Spanish Bills Receivable Format report

Column Descriptions

Name	Null?	Type	Description
BATCH_ID	NULL	NUMBER(15)	Unique batch identifier for the report
BR_ID	NULL	NUMBER(15)	Unique transaction identifier for the bills receivable that are included in the report
LINE_ID	NULL	NUMBER(15)	Unique line identifier for the concurrent request
REQUEST_ID	NULL	NUMBER(15)	Unique concurrent request identifier
FORMAT_TEXT	NULL	VARCHAR2(240)	Bills receivable format data that appears in the report output

## AR\_BR\_STAMP\_VALUES\_ALL

The AR\_BR\_STAMP\_VALUES\_ALL table is a bills receivable-specific table that contains stamp information. For an accepted bill receivable to have full legal weight, the bill must be accompanied by the correct government-issued stamp, the value of which is directly related to the bill receivable amount. The AR\_BR\_STAMP\_VALUES\_ALL table stores the values of stamps for ranges of bills receivable amounts.

The primary key for this table is STAMP\_ID.

## AR\_CALL\_ACTIONS

The AR\_CALL\_ACTIONS table stores information about each call action that you enter in the Customer Calls window. Each row includes the action and amount of a call action. Oracle Receivables creates one row in the AR\_CALL\_ACTIONS table for each call action that you enter and stores the rest of the call action information in other tables.

The AR\_NOTES table stores information that you enter in the Call Action MemoPad, while the AR\_ACTION\_NOTIFICATIONS table links the CALL\_ACTION\_ID column with an employee name.

Receivables uses this call action information to inform collectors of the actions to take against customer accounts. This call action information is visible online in the Scheduler window as well as in the Call Actions report.

The primary key for this table is CALL\_ACTION\_ID.

## AR\_CASH\_BASIS\_DISTS\_ALL

This table stores distribution information for Cash Basis accounting. Oracle Receivables loads this table when you post to your general ledger. This table shows the distribution of receipt amounts over the revenue accounts of an invoice. If you do not specify an invoice line for a receipt, Oracle Receivables first automatically prorates the receipt to pay off all invoice lines, and then prorates tax, freight, and receivables charges. One record is created for each distribution.

For example, if you have an invoice with 5 lines, each for \$10 and you apply a \$50 payment, you create 5 records in this table. Oracle Receivables uses the **CUSTOMER\_TRX\_ID**, **CODE\_COMBINATION\_ID**, and **CUSTOMER\_TRX\_LINE\_ID** columns to store tax distribution information.

The primary key for this table is **CASH\_BASIS\_DISTRIBUTION\_ID**.

## AR\_CASH\_RECEIPTS\_ALL

The AR\_CASH\_RECEIPTS\_ALL table stores one record for each receipt that you enter. Oracle Receivables concurrently creates records in the AR\_CASH\_RECEIPT\_HISTORY\_ALL, AR\_PAYMENT\_SCHEDULES\_ALL, and AR\_RECEIVABLE\_APPLICATIONS\_ALL tables for invoice-related receipts. For receipts that are not related to invoices, such as miscellaneous receipts, Receivables creates records in the AR\_MISC\_CASH\_DISTRIBUTIONS\_ALL table instead of the AR\_RECEIVABLE\_APPLICATIONS\_ALL table.

Receivables associates a status with each receipt. These statuses include:

- APP – Applied
- UNAPP – Unapplied
- UNID – Unidentified
- NSF – Non-sufficient funds
- REV – Reversed receipt
- STOP – Stop payment

Receivables does not update the status of a receipt from UNAPP to APP until the entire amount of the receipt is either applied or placed on account. A receipt can have a status of APP even if the entire receipt amount is placed on account.

Cash receipts proceed through the confirmation, remittance, and clearance steps. Each step creates rows in the AR\_CASH\_RECEIPT\_HISTORY table. The CODE\_COMBINATION\_ID column in this table stores the accounts that are debited and credited as part of the cycle of steps.

The RECEIVABLES\_TRX\_ID column links the AR\_CASH\_RECEIPTS\_ALL table to the AR\_RECEIVABLES\_TRX\_ALL table and identifies the receivables activity that you select when you enter miscellaneous receipts.

The DISTRIBUTION\_SET\_ID column links the AR\_CASH\_RECEIPTS\_ALL table to the AR\_DISTRIBUTION\_SETS\_ALL table and identifies the distribution set and the distribution set line accounts that are credited when you enter miscellaneous receipts.

The CUSTOMER\_BANK\_ACCOUNT\_ID column replaced the CUSTOMER\_MICR\_ID column as a pointer to the customer bank account. The CUSTOMER\_BANK\_ACCOUNT\_ID column is a foreign key to the AP\_BANK\_ACCOUNTS\_ALL table for bank accounts that do not belong to you and have a type of EXTERNAL.

The GL\_DATE and REVERSAL\_GL\_DATE columns were also moved to the AR\_CASH\_RECEIPT\_HISTORY\_ALL table because each step has its own General Ledger date and accounting impact.

The primary key for this table is CASH\_RECEIPT\_ID, which identifies the receipt transaction that created the row for the receipt.

### Database Triggers

Trigger Name : AX\_AR\_CASH\_RECEIPTS\_ARD1  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : DELETE

The AX\_AR\_CASH\_RECEIPTS\_ARD1 trigger captures information that is needed to create subledger accounting events when the Set of Books used is defined as a Global Accounting Engine Set of Books for the Oracle Receivables application. This trigger captures accounting events that are related to Oracle Receivables receipts deletion, and fires before a receipt is deleted.

This trigger may insert, update, or delete rows in the AX\_DOCUMENT\_STATUSES and AX\_EVENTS tables.

Trigger Name : AX\_AR\_CASH\_RECEIPTS\_ARI1  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : INSERT

The AX\_AR\_CASH\_RECEIPTS\_ARI1 trigger captures information that is needed to create subledger accounting events when the Set of Books used is defined as a Global Accounting Engine Set of Books for the Oracle Receivables application. This trigger captures accounting events that are related to Oracle Receivables receipts, and fires right after a receipt is created.

This trigger may insert, update, or delete rows in the AX\_DOCUMENT\_STATUSES and AX\_EVENTS tables.

Trigger Name : AX\_AR\_CASH\_RECEIPTS\_ARU1  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : UPDATE

The AX\_AR\_CASH\_RECEIPTS\_ARU1 trigger captures information that is needed to create subledger accounting events when the Set of Books used is defined as a Global Accounting Engine Set of Books for the Oracle Receivables application. This trigger captures accounting events that are related to Oracle Receivables receipts, and fires right after a customer site of the receipt is changed.

This trigger updates a row of the AX\_DOCUMENT\_STATUSES table.

Trigger Name : AR\_MRC\_CASH\_RECEIPTS\_BIUD  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT, UPDATE, DELETE

The AR\_MRC\_CASH\_RECEIPTS\_BIUD trigger is an MRC trigger that only exists when you install the Multiple Reporting Currencies feature. This trigger runs when you perform an insert, update, or delete statement on the AR\_CASH\_RECEIPTS\_ALL table. For each record that is inserted, updated, or deleted in the AR\_CASH\_RECEIPTS\_ALL table, this trigger inserts, updates, or deletes the corresponding reporting currency records in the AR\_MC\_CASH\_RECEIPTS MRC subtable. In addition, this trigger populates the MRC VARCHAR2 columns in the AR\_CASH\_RECEIPTS\_ALL table.

# AR\_CASH\_RECEIPT\_HISTORY\_ALL

The AR\_CASH\_RECEIPT\_HISTORY\_ALL table contains each step in a receipt’s lifecycle. Each row in this table represents one step. The STATUS column indicates which step the receipt has reached:

- APPROVED – This status is valid only for an automatically created receipt and indicates that the receipt was approved for automatic creation.
- CONFIRMED – This status is valid only for an automatically created receipt and indicates that the receipt was confirmed by the customer.
- REMITTED – This status is valid for both automatically and manually created receipts and indicates that the receipt was remitted.
- CLEARED – This status is valid for both automatically and manually created receipts and indicates that the receipt was cleared.
- REVERSED – This status is valid for both automatically and manually created receipts and indicates that the receipt was reversed.

Oracle Receivables posts each row in this table to General Ledger. Each row debits the account that is represented by the ACCOUNT\_CODE\_COMBINATION\_ID column on the date specified in the GL\_DATE column and credits the account on the date specified in the REVERSAL\_GL\_DATE column, if a date is present in this column. Optionally, each row will also debit (on the date specified in the GL\_DATE column) and credit (on the date specified in the REVERSAL\_GL\_DATE column) the account that is represented by the BANK\_CHARGE\_ACCOUNT\_CCID column for the amount in the FACTOR\_DISCOUNT\_AMOUNT column, which is the difference between the remitted amount and the cleared amount.

The CURRENT\_RECORD\_FLAG column points you to the current row, which is the current status of the cash receipt. The POSTABLE\_FLAG column determines if a row can be posted to General Ledger.

The primary key for this table is CASH\_RECEIPT\_HISTORY\_ID.

Name	Null?	Type	Description
CASH_RECEIPT_HISTORY_ID (PK)	NOT NULL	NUMBER(15)	Cash receipt history identifier
CASH_RECEIPT_ID	NOT NULL	NUMBER(15)	MRC only: Concatenated string of reporting Set of Books ID, cash receipt identifier pairs
STATUS	NOT NULL	VARCHAR2(30)	One of the following: APPROVED, CONFIRMED, REMITTED, CLEARED, REVERSED
TRX_DATE	NOT NULL	DATE	The transaction date when this history row occurs as entered by the user
AMOUNT	NOT NULL	NUMBER	The amount for this step of the lifecycle of the receipt. Most of the amounts will be similar to the original amount of the cash receipt but the cleared amount might be different from the remitted due to any charges the bank took.
FIRST_POSTED_RECORD_FLAG	NOT NULL	VARCHAR2(1)	This is Y if this is the first row that is posted for this cash receipts; N otherwise.
POSTABLE_FLAG	NOT NULL	VARCHAR2(1)	This is Y if the row is postable and N otherwise. It is N for the approved row and N for the REVERSED row. It is Y for all the other statuses.
FACTOR_FLAG	NOT NULL	VARCHAR2(1)	This is Y if the status is REMITTED and the cash receipt was factored as specified by the user on the remittance step.
GL_DATE	NOT NULL	DATE	The General Ledger Date that is used when debiting the ACCOUNT_CODE_COMBINATION_ID
CURRENT_RECORD_FLAG	NULL	VARCHAR2(1)	This is Y if this row is the latest step for this cash receipt; it is null otherwise.
BATCH_ID	NULL	NUMBER(15)	This is a foreign key to the AR_BATCHES table that points to the batch that was used to create this row for this cash receipt.
ACCOUNT_CODE_COMBINATION_ID	NULL	NUMBER(15)	This is the account that is either debited or credited (on the GL_DATE and REVERSAL_GL_DATE respectively).
REVERSAL_GL_DATE	NULL	DATE	This is the General Ledger Date that is used to credit the ACCOUNT_CODE_COMBINATION_ID. It also signifies that this row has been reversed. It could mean that the receipt went on to the next step or reverted one step.

## Database Triggers

Trigger Name : AX\_AR\_CASH\_RECEIPT\_HIST\_BRI1  
 Trigger Time : BEFORE  
 Trigger Level : ROW  
 Trigger Event : INSERT

The AX\_AR\_CASH\_RECEIPT\_HIST\_BRI1 trigger captures information that is needed to create subledger accounting events when the Set of Books used is defined as a Global Accounting Engine Set of Books for the Oracle Receivables application. This trigger may insert, update, or delete rows in the AX\_DOCUMENT\_STATUSES and AX\_EVENTS tables and captures accounting events related to Oracle Receivables receipts. This trigger fires before a receipt is reversed or the value in the POSTABLE\_FLAG column is changed to Y.

Trigger Name : AR\_MRC\_CASH\_HISTORY\_BID  
 Trigger Time : BEFORE  
 Trigger Level : ROW  
 Trigger Event : INSERT, DELETE

The AR\_MRC\_CASH\_HISTORY\_BID trigger is an MRC trigger that only exists when you install the Multiple Reporting Currencies feature. This trigger runs when you perform an insert, update, or delete statement on the AR\_CASH\_RECEIPT\_HISTORY\_ALL table. For each record that is inserted, updated, or deleted in the AR\_CASH\_RECEIPT\_HISTORY\_ALL table, this trigger inserts, updates, or deletes the corresponding reporting currency records in the AR\_MC\_CASH\_RECEIPT\_HIST MRC subtable. This trigger also populates the MRC VARCHAR2 columns in the AR\_CASH\_RECEIPT\_HISTORY\_ALL table.

# AR\_COLIND

The AR\_COLIND table is a temporary table used by the Oracle Business Intelligence System (BIS). This table stores values that the drill down reports from the Collection Indicators report use to calculate the Days Sales Outstanding (DSO) as well as the receivables turnover.

Column Descriptions

Name	Null?	Type	Description
CUSTOMER_ID	NULL	NUMBER(15)	Identifies the customer associated with the report values
ORIG_AMT	NULL	NUMBER	Sum of the original amounts in functional currency from payment schedules that fall within report cut-off period
ADJ1_AMT	NULL	NUMBER	The sum of all adjustments that fall within the cut-off period
REC_AMT	NULL	NUMBER	The total amount received after the cut-off period
ADJ2_AMT	NULL	NUMBER	The sum of all adjustments created after the cut-off period
REM_AMT	NULL	NUMBER	Sum of the remaining amount in functional currency from payment schedules that fall within report cut-off period

## AR\_COLLECTION\_INDICATORS\_ALL

The AR\_COLLECTION\_INDICATORS\_ALL table stores collection information for the Oracle Business Intelligence System (BIS) Collection Indicators report. Run this report monthly for Oracle Receivables to record and store your collection data. Each row includes collector effectiveness indicator information for one month. Use this information on the report to determine how effectively your organization collects on outstanding receivables.

The primary key for this table is COLLECTION\_INDICATOR\_ID.

## AR\_COLLECTORS

The AR\_COLLECTORS table stores information about your receivables collectors. Each row includes the collector's name, description, correspondence name, telephone number, and status. You need one row for each collector.

Oracle Receivables uses this collector information to speed up data entry when you record customer calls and maintain customer credit profiles and customer profile classes.

The primary key for this table is COLLECTOR\_ID.

# AR\_CONC\_PROCESS\_REQUESTS

The AR\_CONC\_PROCESS\_REQUESTS table contains a list of Oracle Receivables AutoInvoice and Customer Merge concurrent requests that are or should be currently running. Because the AutoInvoice and Customer Merge programs can run multiple instances at the same time, the information in this table tells these programs which requests are current. For example, AutoInvoice might encounter an error or terminate abnormally. The corresponding row is marked with the request that is not current. A new run of AutoInvoice will mark that row again.

The primary key for this table is REQUEST\_ID.

## AR\_CONS\_INV\_ALL

The AR\_CONS\_INV\_ALL table stores information about consolidated billing invoices, including invoice numbers, customer balances, and due dates. A consolidated billing invoice is a bill sent to a customer that contains all invoices created during a period that you define, for example, one month. When you run the Consolidated Billing Invoice program to create a consolidated billing invoice, the information about the consolidated billing invoice is stored in this table.

## AR\_CONS\_INV\_TRX\_ALL

The AR\_CONS\_INV\_TRX\_ALL table contains header-level information about transactions that are included on a consolidated billing invoice. Transactions include invoices, credit memos, cash receipts, invoice cancellations, cash receipt reversals, cross-site cash receipt applications, and adjustments.

Rows are created when you run the Consolidated Billing Invoice program to create a consolidated billing invoice. These rows are deleted when a consolidated billing invoice is rejected.

## AR\_CORRESPONDENCES\_ALL

The AR\_CORRESPONDENCES\_ALL table stores a record for each dunning letter that you send to a customer. Each row includes dunning letter information such as date, customer, and site use. Oracle Receivables stores other detailed information for your dunning letter in the AR\_DUNNING\_LETTERS table. Oracle Receivables uses this detailed information to determine which letter was sent to your customer on a specific date.

The primary key for this table is CORRESPONDENCE\_ID.

## AR\_CREDIT\_MEMO\_AMOUNTS

The AR\_CREDIT\_MEMO\_AMOUNTS table stores the amount of revenue reduction that is recognized when you apply a credit memo. The table also stores the corresponding General Ledger date. For example, you initially recognize revenue of one million. If you create a credit memo today of twenty thousand as a reserve against returns, this table stores 20000 in the AMOUNT column and today's date in the GL\_DATE column.

The primary key for this table is CREDIT\_MEMO\_AMOUNT\_ID.

# AR\_CUSTOMER\_ALT\_NAMES

The AR\_CUSTOMER\_ALT\_NAMES table stores alternate customer names that are often used by Japanese businesses. The records in this table, which are used for AutoLockbox name matching, originate from the bank files in the Japanese Zengin format that were imported using AutoLockbox.

When bank files in the Japanese Zengin format are imported, customers must match Zengin receipts with customer information before the records can be validated and posted. When Zengin receipts are matched with customer information, Oracle Receivables updates the AR\_CUSTOMER\_ALT\_NAMES table so that the next time AutoLockbox runs, Oracle Receivables can automatically match unidentified receipts to these customers.

The primary key for this table is ALT\_NAME\_ID.

## AR\_CUSTOMER\_BALANCE\_ITF

The AR\_CUSTOMER\_BALANCE\_ITF table is an interface table that stores the records that the Customer Open Balance Letter report selects based on the parameters specified during report submission. The AR\_CUSTOMER\_BALANCE\_ITF table is a denormalized table that is used for storing the organization name, address, customer transaction, or receipt level information. Oracle Receivables uses the values that are populated by the data extract programs to print the columns in the Customer Open Balance Letter.

## AR\_CUSTOMER\_CALLS\_ALL

The AR\_CUSTOMER\_CALLS\_ALL table stores information about customer calls, including the bill-to site, promise date, and reason for the call. Each row includes customer and response information, as well as follow-up details for the customer call. You can review customer calls in the Customer Calls window.

The primary key for this table is CUSTOMER\_CALL\_ID.

## AR\_CUSTOMER\_CALL\_TOPICS\_ALL

The AR\_CUSTOMER\_CALL\_TOPICS\_ALL table stores information about the topic of customer calls, such as the outcome of the call, the customer's response, and the follow-up date. Each row includes specific collection information regarding your call topic. Oracle Receivables uses this information to display customer calls in the Record A Call, Call History, and Collection reports.

The primary key for this table is CUSTOMER\_CALL\_TOPIC\_ID.

## AR\_DISPUTE\_HISTORY

The AR\_DISPUTE\_HISTORY table stores dispute history for each payment schedule. Oracle Receivables creates a row in this table each time that the AMOUNT\_IN\_DISPUTE column is changed in the AR\_PAYMENT\_SCHEDULES table.

The primary key for this table is DISPUTE\_HISTORY\_ID.

## AR\_DISTRIBUTIONS\_ALL

The AR\_DISTRIBUTIONS\_ALL table stores the accounting distributions for cash receipts, miscellaneous receipts, adjustments, credit memo applications, cash receipt applications, and bills receivable transactions. The records are joined to the AR\_CASH\_RECEIPT\_HISTORY\_ALL, AR\_MISC\_CASH\_DISTRIBUTIONS\_ALL, AR\_ADJUSTMENTS, AR\_RECEIVABLE\_APPLICATIONS\_ALL, and AR\_TRANSACTION\_HISTORY\_ALL tables.

For cash receipt headers, the SOURCE\_TABLE is CRH and the SOURCE\_ID is AR\_CASH\_RECEIPT\_HISTORY\_ALL.CASH\_RECEIPT\_HISTORY\_ID. The SOURCE\_TYPE can be:

- CONFIRMATION
- REMITTANCE
- CASH
- FACTOR
- SHORT\_TERM\_DEBT
- BANK\_CHARGES

For receivable applications records, the SOURCE\_TABLE is RA and the SOURCE\_ID is AR\_RECEIVABLE\_APPLICATIONS\_ALL.RECEIVABLE\_APPLICATION\_ID. The SOURCE\_TYPE can be:

- REC for receivable accounts
- EDISC for earned discounts
- UNEDISC for unearned discounts
- TAX for collectable tax
- DEFERRED\_TAX for deferred tax,
- EDISC\_NON\_REC for non-recoverable earned discounts
- UNEDISC\_NON\_REC for non-recoverable unearned discounts
- EXCH\_GAIN for exchange gain
- EXCH\_LOSS for exchange loss
- CURR\_ROUND for currency rounding

For adjustment records, the SOURCE\_TABLE is ADJ and the SOURCE\_ID is AR\_ADJUSTMENTS\_ALL.ADJUSTMENT\_ID. The SOURCE\_TYPE can be:

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

- REC for receivable accounts
- ADJ for adjustment accounts
- FINCHRG for finance charges
- ADJ\_NON\_REC for non-recoverable adjustments
- FINCHRG\_NON\_REC for non-recoverable finance charges

For miscellaneous receipt records, the SOURCE\_TABLE is MCD and the SOURCE\_ID is AR\_MISC\_CASH\_DISTRIBUTIONS\_ALL.MISC\_CASH\_DISTRIBUTIONS\_ID. The SOURCE\_TYPE can be:

- MISCCASH for cash accounts
- TAX for tax

For bills receivable records, the SOURCE\_TABLE is TH and the SOURCE\_ID is AR\_TRANSACTION\_HISTORY\_ALL.TRANSACTION\_HISTORY\_ID. The SOURCE\_TYPE can be:

- DEFERRED\_TAX for deferred tax
- FACTOR for factor
- REC for receivable
- REMITTANCE for remittance
- TAX for tax
- UNPAIDREC for unpaid bills

The primary keys for this table are SOURCE\_ID, SOURCE\_TABLE, and SOURCE\_TYPE.

#### Database Triggers

Trigger Name : AR\_MRC\_DISTRIBUTIONS\_BIUD  
 Trigger Time : BEFORE  
 Trigger Level : ROW  
 Trigger Event : INSERT, UPDATE, DELETE

The AR\_MRC\_DISTRIBUTIONS\_BIUD trigger exists only when you install the Multiple Reporting Currencies feature and executes when you perform an insert, update, or delete statement on the AR\_DISTRIBUTIONS\_ALL table.

For each record that is inserted, updated, or deleted in the AR\_DISTRIBUTIONS\_ALL table, this trigger inserts, updates, or deletes corresponding reporting currency records in the AR\_MC\_DISTRIBUTIONS\_ALL MRC subtable.

**AR\_DISTRIBUTION\_SETS\_ALL**

The AR\_DISTRIBUTION\_SETS\_ALL table stores general information about your distribution sets, such as the name, description, and status. Use the AR\_DISTRIBUTION\_SETS\_ALL table with the AR\_DISTRIBUTION\_SET\_LINES\_ALL table to automatically distribute your other receipt payments. The percentage total for lines that are allocated in each distribution set must equal 100%. Oracle Receivables displays distribution sets as list of values choices to speed data entry.

The primary key for this table is DISTRIBUTION\_SET\_ID.

## AR\_DISTRIBUTION\_SET\_LINES\_ALL

The AR\_DISTRIBUTION\_SET\_LINES\_ALL table stores specific information, such as GL account information, for individual distribution lines in a distribution set. Each row joins this accounting information with receipt distribution allocations. The total percent of all distribution set lines must equal 100% for each distribution set. Oracle Receivables creates one row for each receipt distribution percentage allocation. The AR\_DISTRIBUTION\_SETS\_ALL table stores general information about your distribution set, such as the name, description, and status. Oracle Receivables uses distribution sets to speed data entry.

The primary keys for this table are DISTRIBUTION\_SET\_ID and DIST\_CODE\_COMBINATION\_ID.

## AR\_DOC\_SEQUENCE\_AUDIT

The AR\_DOC\_SEQUENCE\_AUDIT table stores a row for every document number that is generated. Document sequences generate audit data, and even if documents are deleted, their audit records remain in this table.

The primary keys for this table are DOC\_SEQUENCE\_ID and DOC\_SEQUENCE\_VALUE.

## AR\_DUNNING\_LETTERS\_B

The AR\_DUNNING\_LETTERS\_B table stores information about your dunning letters, such as a dunning letter's unique identifier and current status. Use dunning letters to inform your customers of past due invoices, debit memos, and chargebacks. Oracle Receivables creates one row for each dunning letter. You define dunning letter sequences in the AR\_DUNNING\_LETTER\_SETS table.

The primary key for this table is DUNNING\_LETTER\_ID.

## AR\_DUNNING\_LETTERS\_CUSTOM\_TL

The AR\_DUNNING\_LETTERS\_CUSTOM\_TL table provides multilingual support (MLS) for custom dunning letters that you create in the Dunning Letters window. MLS lets you store and print data that you define in multiple languages. If you have MLS, you can define dunning letters in each of your installed languages. When you print a dunning letter, Oracle Receivables prints the stored message in the appropriate language.

The primary keys for this table are DUNNING\_LETTER\_ID, PARAGRAPH\_NUMBER, and LANGUAGE.

# AR\_DUNNING\_LETTERS\_TL

The AR\_DUNNING\_LETTERS\_TL table provides multilingual support (MLS) for dunning letters that you define using one of the templates that Oracle Receivables provides.

MLS lets you store and print data that you define in multiple languages. If you have MLS, you can define dunning letters in each of your installed languages. When you print a dunning letter, Oracle Receivables prints the stored message in the appropriate language.

The primary keys for this table are DUNNING\_LETTER\_ID and LANGUAGE.

# AR\_DUNNING\_LETTER\_SETS

The AR\_DUNNING\_LETTER\_SETS table stores the sequence that you would like dunning letters, which are stored in the AR\_DUNNING\_LETTERS table, sent to your customers. Oracle Receivables stores one row in the AR\_DUNNING\_LETTER\_SETS table for each sequence.

Dunning letter sets let you vary the tone of your communications to your customers. For example, your first letter to a customer could be a friendly reminder about an overdue payment. The second letter could warn the customer of possible finance charge penalties as a result of a late payment. The third letter could threaten the customer with a credit hold if no payment is received.

Use customer profile classes to assign dunning letter sets to your customers. Profile class information is stored in the AR\_CUSTOMER\_PROFILES table.

The primary key for this table is DUNNING\_LETTER\_SET\_ID.

## AR\_DUNNING\_LETTER\_SET\_LINES

The AR\_DUNNING\_LETTER\_SET\_LINES table stores the individual lines of a dunning letter set. Use the AR\_DUNNING\_LETTER\_SETS table to store dunning letter sets. Each line of a dunning letter set includes a dunning letter and a date range, if applicable. For example, you may choose to send Letter 1 to all customers with invoices that are 1 to 30 days past due. You can also include current invoices that are not yet due, or copies of invoices with each dunning letter.

The primary keys for this table are DUNNING\_LETTER\_SET\_ID and DUNNING\_LINE\_NUM.

## AR\_INTERIM\_CASH\_RCPT\_LINES\_ALL

The AR\_INTERIM\_CASH\_RCPT\_LINES\_ALL table is a temporary table that stores entries for each QuickCash receipt application. After you run the Post QuickCash program, Oracle Receivables creates an entry in the AR\_RECEIVABLE\_APPLICATIONS\_ALL table for each application. Receivables then deletes data from this table.

The primary keys for this table are CASH\_RECEIPT\_ID and CASH\_RECEIPT\_LINE\_ID.

## AR\_INTERIM\_CASH\_RECEIPTS\_ALL

The AR\_INTERIM\_CASH\_RECEIPTS\_ALL table is a temporary table that stores entries for receipts that were entered via QuickCash. Oracle Receivables creates one record for each receipt. If you enter a receipt with a status of unapplied, unidentified, or on-account, or if you apply payment to one invoice, Receivables stores both payment and application information in this table.

When the payment is applied to multiple invoices, Receivables creates one record for each receipt application in the AR\_INTERIM\_CASH\_RCPT\_LINES\_ALL table. After you run the Post QuickCash program, Receivables creates a record in the AR\_CASH\_RECEIPTS\_ALL table for each receipt and a record in the AR\_RECEIVABLE\_APPLICATIONS\_ALL table for each receipt application. Receivables then deletes data from this table.

The primary key for this table is CASH\_RECEIPT\_ID.

# AR\_INTERIM\_POSTING

The AR\_INTERIM\_POSTING table stores posting information when you use the cash basis accounting method. The Oracle Receivables posting program automatically places records in this table when you post to General Ledger.

The primary key for this table is CASH\_RECEIPT\_ID.

## AR\_INVOICE\_ADJ\_V

The AR\_INVOICE\_ADJ\_V view, which is one of eight transaction printing views that Oracle Receivables provides, collects information about invoice adjustments. A system administrator or Oracle consultant can use transaction printing views to extract transaction information from Receivables and then print the data in a custom format using Oracle Reports or a similar SQL-based report generator.

## AR\_INVOICE\_COMMITMENT\_INFO\_V

The AR\_INVOICE\_COMMITMENT\_INFO\_V view, which is one of eight transaction printing views that Oracle Receivables provides, collects information about commitments (guarantees and deposits). A system administrator or Oracle consultant can use transaction printing views to extract transaction information from Receivables and then print the data in a custom format using Oracle Reports or a similar, SQL-based report generator.

## AR\_INVOICE\_HEADER\_V

The AR\_INVOICE\_HEADER\_V view, which is one of eight transaction printing views that Oracle Receivables provides, collects header-level information for invoices. A system administrator or Oracle consultant can use transaction printing views to extract transaction information from Receivables and then print the data in a custom format using Oracle Reports or a similar, SQL-based report generator.

## AR\_INVOICE\_INSTALLMENTS\_V

The AR\_INVOICE\_INSTALLMENTS\_V view, which is one of eight transaction printing views that Oracle Receivables provides, collects information about invoice installments. A system administrator or Oracle consultant can use transaction printing views to extract transaction information from Receivables and then print the data in a custom format using Oracle Reports or a similar, SQL-based report generator.

## AR\_LOCATION\_COMBINATIONS

The AR\_LOCATION\_COMBINATIONS table stores the combinations of taxing jurisdictions that together define a tax authority. Rows in this table can be manually created using the Tax Authorities window or automatically created by database triggers against the RA\_ADDRESSES\_ALL table.

Each address that exists within the default country, as defined by Oracle Receivables system parameters, will have a set of taxing jurisdictions that are automatically created for that address. Database triggers automatically perform the combination of these jurisdictions into an authority.

Whenever new records are created in the AR\_LOCATION\_COMBINATIONS table, more database triggers automatically create compiled sales tax rates for this taxing authority into the AR\_SALES\_TAX table. Only those locations and rates that have overlapping postal code and effective date ranges are combined into a single record in the AR\_SALES\_TAX table.

The primary key for this table is LOCATION\_ID.

## Database Triggers

Trigger Name : AR\_LOCATION\_COMBINATIONS\_BRU  
 Trigger Time : BEFORE  
 Trigger Level : ROW  
 Trigger Event : UPDATE

The AR\_LOCATION\_COMBINATIONS\_BRI trigger populates the AR\_SALES\_TAX table with the combined tax rates that are identified for each field within your Sales Tax Location Flexfield, typically state, county, and city.

Trigger Name : AR\_LOCATION\_COMBINATIONS\_BRI  
 Trigger Time : BEFORE  
 Trigger Level : ROW  
 Trigger Event : INSERT

The AR\_LOCATION\_COMBINATIONS\_BRU trigger populates the AR\_SALES\_TAX table with the combined tax rates that are identified for each field within your Sales Tax Location Flexfield, typically state, county, and city.

## AR\_LOCATION\_RATES

The AR\_LOCATION\_RATES table stores postal code ranges, effective dates, and sales tax rates for each jurisdiction that is defined in the AR\_LOCATION\_VALUES table. Records are automatically created in this table using the Oracle Receivables Sales Tax Interface program, or manually created using the Tax Locations and Rates window.

Whenever new records are created or old ones are updated in this table, database triggers recompile all associated sales tax rates into the AR\_SALES\_TAX table. Only those locations and rates that have overlapping postal code and effective date ranges for every segment of the Sales Tax Location Flexfield will have corresponding rows created in the AR\_SALES\_TAX table.

The primary keys for this table are LOCATION\_SEGMENT\_ID, START\_DATE, END\_DATE, FROM\_POSTAL\_CODE, TO\_POSTAL\_CODE, and TAX\_RATE.

#### Database Triggers

Trigger Name : AR\_LOCATION\_RATES\_BRIUD  
 Trigger Time : BEFORE  
 Trigger Level : ROW  
 Trigger Event : INSERT, UPDATE, DELETE

The AR\_LOCATION\_RATES\_BRIUD trigger validates that the start date precedes the end date and that the value for the FROM\_POSTAL\_CODE column is less than the TO\_POSTAL\_CODE column. This trigger also compiles the rates, which are transferred into the AR\_SALES\_TAX table by the AR\_LOCATION\_RATES\_ASIUD trigger.

Trigger Name : AR\_LOCATION\_RATES\_ASIUD  
 Trigger Time : AFTER  
 Trigger Level : ROW  
 Trigger Event : INSERT, UPDATE, DELETE

The AR\_LOCATION\_RATES\_ASIUD trigger transfers multiple rates into the AR\_SALES\_TAX table, combining each of the fields from your Sales Tax Location Flexfield, typically state, county, and city. This after statement trigger uses data compiled during the execution of the AR\_LOCATION\_RATES\_BSIUD and AR\_LOCATION\_RATES\_BRIUD triggers.

Trigger Name : AR\_LOCATION\_RATES\_BSIUD  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT, UPDATE, DELETE

The AR\_LOCATION\_RATES\_BSIUD trigger initializes the transfer of rates into the AR\_SALES\_TAX table. The tax rates are transferred by the AR\_LOCATION\_RATES\_ASIUD trigger.

# AR\_LOCATION\_VALUES

The AR\_LOCATION\_VALUES table defines each jurisdiction that Oracle Receivables uses to validate segments of a customer address and compile sales tax rates.

The Sales Tax Location Flexfield defines the structure that Receivables uses to relate one segment of an address to another. Rows are automatically created in this table either by using the Oracle Receivables Sales Tax Interface program, or when a new customer address is created. Rows can also be manually created using the Tax Locations and Rates window.

Locations exist within other parent locations. Receivables uses the PARENT\_SEGMENT\_ID column to enforce this business rule. The first or senior segment of the Sales Tax Location Flexfield is exempt from this ownership rule.

The primary keys for this table are LOCATION\_SEGMENT\_QUALIFIER, LOCATION\_SEGMENT\_VALUE, and PARENT\_SEGMENT\_ID.

## AR\_LOCKBOXES\_ALL

The AR\_LOCKBOXES\_ALL table stores information about your Lockboxes. AutoLockbox (or Lockbox) is a service that commercial banks offer corporate customers to enable them to outsource their accounts receivable payment processing. An AutoLockbox operation can process millions of transactions a month.

AutoLockbox eliminates manual data entry by automatically processing receipts that are sent directly to your bank. You specify how you want this information transmitted and Receivables ensures that the data is valid before creating QuickCash receipt batches. AutoLockbox uses your Lockbox definitions when transferring receipts from your bank file into Oracle Receivables.

The primary key for this table is LOCKBOX\_ID.

## AR\_MC\_CASH\_BASIS\_DISTS\_ALL

The AR\_MC\_CASH\_BASIS\_DISTS\_ALL table stores distribution information for cash basis accounting. Oracle Receivables loads this table when you post to General Ledger. This table shows the distribution of receipt amounts over the revenue accounts of an invoice. If you do not specify an invoice line for a receipt, Oracle Receivables automatically prorates the receipt to pay off all invoice lines and then tax, freight, and receivables charges.

Oracle Receivables creates one record for each distribution. For example, if you have an invoice with five lines, each for \$10, and you apply a \$50 payment, you create five records in this table. Oracle Receivables uses the CUSTOMER\_TRX\_ID, CODE\_COMBINATION\_ID, and CUSTOMER\_TRX\_LINE\_ID columns to store tax distribution information.

The primary keys for this table are SET\_OF\_BOOKS\_ID and CASH\_BASIS\_DISTRIBUTION\_ID.

## AR\_MC\_MISC\_CASH\_DISTS

The AR\_MC\_MISC\_CASH\_DISTS table is a Multiple Reporting Currencies (MRC) subtable of the AR\_MISC\_CASH\_DISTRIBUTIONS\_ALL table. The AR\_MC\_MISC\_CASH\_DISTS table stores currency and accounting information about miscellaneous cash applications for each reporting Set of Books that is associated with the parent record in the AR\_MISC\_CASH\_DISTRIBUTIONS\_ALL table.

The primary keys for this table are MISC\_CASH\_DISTRIBUTION\_ID and CASH\_RECEIPT\_ID.

### Column Descriptions

AR\_MC\_PAYMENT\_SCHEDULES

The AR\_MC\_PAYMENTS\_SCHEDULES table is a Multiple Reporting Currencies (MRC) subtable of the AR\_PAYMENT\_SCHEDULES\_ALL table. The AR\_MC\_PAYMENT\_SCHEDULES table stores currency-related information about all transactions except adjustments and miscellaneous cash receipts for each reporting Set of Books that is associated with the parent record in the AR\_PAYMENT\_SCHEDULES\_ALL table.

Oracle Receivables updates this table when a transaction occurs against an invoice, debit memo, chargeback, credit memo, on-account credit, or receipt.

The primary keys for this table are SET\_OF\_BOOKS\_ID and PAYMENT\_SCHEDULE\_ID.

Column Descriptions

## AR\_MC\_RATE\_ADJUSTMENTS

The AR\_MC\_RATE\_ADJUSTMENTS table is a Multiple Reporting Currencies (MRC) subtable of the AR\_RATE\_ADJUSTMENTS\_ALL table. The AR\_MC\_RATE\_ADJUSTMENTS table stores currency-related information about exchange rate adjustments for each reporting Set of Books that is associated with the parent record in the AR\_RATE\_ADJUSTMENTS\_ALL table. Oracle Receivables lets you make adjustments to the rate, rate type, or rate date after posting to General Ledger.

The primary keys for this table are SET\_OF\_BOOKS\_ID and RATE\_ADJUSTMENT\_ID.

### Column Descriptions

# AR\_MC\_RECEIVABLE\_APPS

The AR\_MC\_RECEIVABLE\_APPS table is a Multiple Reporting Currencies (MRC) subtable of the AR\_RECEIVABLE\_APPLICATIONS\_ALL table. The AR\_MC\_RECEIVABLE\_APPS table stores information about cash and credit memo applications for each reporting Set of Books that is associated with the parent record in the AR\_RECEIVABLE\_APPLICATIONS\_ALL table.

Each row includes the amount applied, status, and the Set of Books that the row applies to. The GL\_POSTED\_DATE and POSTING\_CONTROL\_ID columns are updated for each reporting Set of Books when posting is run for that book.

The primary keys for this table are RECEIVABLE\_APPLICATION\_ID and SET\_OF\_BOOKS\_ID.

Column Descriptions

AR\_MC\_TRANSACTION\_HISTORY

The AR\_MC\_TRANSACTION\_HISTORY table is a Multiple Reporting Currencies (MRC) subtable of the AR\_TRANSACTION\_HISTORY\_ALL table. The AR\_MC\_TRANSACTION\_HISTORY table stores posting-related information about transaction history lines for each reporting Set of Books that is associated with the parent record in the AR\_TRANSACTION\_HISTORY\_ALL table.

Column Descriptions

## AR\_MEMO\_LINES\_ALL\_B

The AR\_MEMO\_LINES\_ALL\_B table stores information about standard memo lines for debit memos, on-account credits, debit memo reversals, chargebacks, and invoices. If AutoAccounting is based on standard line items, Oracle Receivables uses this table to obtain the revenue account.

This table also stores the tax code, unit standard price, unit of measure, and standard invoicing and accounting rules for each standard memo line.

The primary key for this table is MEMO\_LINE\_ID.

## AR\_MEMO\_LINES\_ALL\_TL

The AR\_MEMO\_LINES\_ALL\_TL table provides multilingual support (MLS) for standard memo lines that you define in Oracle Receivables. MLS lets you store and print data that you define in multiple languages. For example, if you define a standard memo line in Spanish, the LANGUAGE column stores the code for Spanish.

## AR\_MISC\_CASH\_DISTRIBUTIONS\_ALL

The AR\_MISC\_CASH\_DISTRIBUTIONS\_ALL table stores all accounting entries for your miscellaneous cash applications. Miscellaneous cash is non-revenue income such as stock revenue, interest income, and investment income.

The AR\_CASH\_RECEIPTS\_ALL table stores one record for each payment while the AR\_MISC\_CASH\_DISTRIBUTIONS\_ALL table stores one record for each receipt distribution.

The primary key for this table is MISC\_CASH\_DISTRIBUTION\_ID.

Trigger Event : INSERT, UPDATE, DELETE

The AR\_MRC\_MISC\_CASH\_DISTs\_BIUD trigger exists only when you install the Multiple Reporting Currencies feature and is executed when you perform an insert, update, or delete statement on the AR\_MISC\_CASH\_DISTRIBUTIONS\_ALL table.

For each record that is inserted, updated, or deleted in the AR\_MISC\_CASH\_DISTRIBUTIONS\_ALL table, this trigger inserts, updates, or deletes corresponding reporting currency records in the AR\_MC\_MISC\_CASH\_DISTs MRC subtable. In addition, this trigger populates the MRC VARCHAR2 columns in the AR\_MISC\_CASH\_DISTRIBUTIONS\_ALL table.

## AR\_NOTES

The AR\_NOTES table stores MemoPad information for customer calls that are entered in the Customer Calls window. The AR\_CALL\_ACTIONS and AR\_CUSTOMER\_CALL\_TOPICS tables both access MemoPad information from this table. Oracle Receivables creates one row for each MemoPad entry.

The primary key for this table is NOTE\_ID.

## AR\_PAYMENTS\_INTERFACE\_ALL

The AR\_PAYMENTS\_INTERFACE\_ALL table stores imported Lockbox information that were not validated. AutoLockbox (or Lockbox) is a service that commercial banks offer corporate customers to enable them to outsource their accounts receivable payment processing. An AutoLockbox operation can process millions of transactions a month.

AutoLockbox creates one row in this table for each record in a transmission. When you run the AutoLockbox validation step, Oracle Receivables transfers the information from the AR\_PAYMENTS\_INTERFACE\_ALL table to the AR\_INTERIM\_CASH\_RECEIPTS\_ALL and AR\_INTERIM\_CASH\_RCPT\_LINES\_ALL tables.

The primary key for this table is TRANSMISSION\_RECORD\_ID.

## AR\_PAYMENT\_SCHEDULES\_ALL

The AR\_PAYMENT\_SCHEDULES\_ALL table stores all transactions except adjustments and miscellaneous cash receipts. Oracle Receivables updates this table when activity occurs against an invoice, debit memo, chargeback, credit memo, on-account credit, or receipt. Oracle Receivables groups different transactions by entering one of these values in the CLASS column:

- INV – Invoice
- DM – Debit Memo
- GUAR – Guarantee
- CM – Credit Memo
- DEP – Deposit
- CB – Chargeback
- PMT – Receipt

Transaction classes determine if a transaction relates to either the RA\_CUSTOMER\_TRX\_ALL table or the AR\_CASH\_RECEIPTS\_ALL table. Using the CUSTOMER\_TRX\_ID foreign key column, the AR\_PAYMENT\_SCHEDULES\_ALL table joins to the RA\_CUSTOMER\_TRX\_ALL table for non-payment transaction entries, such as the creation of credit memos, debit memos, invoices, chargebacks, or deposits. Using the CASH\_RECEIPT\_ID foreign key column, the AR\_PAYMENT\_SCHEDULES\_ALL table joins to the AR\_CASH\_RECEIPTS\_ALL table for invoice-related payment transactions.

When a receipt is applied, Oracle Receivables updates the AMOUNT\_APPLIED, AMOUNT\_DUE\_REMAINING, and STATUS columns. The STATUS column changes from OP to CL for any transaction that has an AMOUNT\_DUE\_REMAINING value of 0. For a receipt, the amount due that remains includes on-account and unapplied amounts. Oracle Receivables stores debit items such as invoices, debit memos, chargebacks, deposits, and guarantees as positive numbers in the AMOUNT\_DUE\_REMAINING and AMOUNT\_DUE\_ORIGINAL columns. Credit items such as credit memos and receipts are stored as negative numbers.

Receipts can be confirmed or not confirmed as designated by the CONFIRMED\_FLAG column. The sum of the AMOUNT\_DUE\_REMAINING column for a customer for all confirmed payment schedules reflects the current customer balance. If this amount

is negative, then the AMOUNT\_DUE\_REMAINING column indicates the credit balance amount that is currently available for this customer. For invoices with split terms, Oracle Receivables creates one record in the RA\_CUSTOMER\_TRX\_ALL table and one record in the AR\_PAYMENT\_SCHEDULES\_ALL table for each installment. In the AR\_PAYMENT\_SCHEDULES\_ALL table, the DUE\_DATE and AMOUNT\_DUE\_REMAINING columns can differ for each installment of a split term invoice. Each installment is differentiated by the TERMS\_SEQUENCE\_NUMBER column.

If you create a debit memo reversal when you reverse a receipt, Oracle Receivables creates a new payment schedule record for the debit memo and populates the REVERSED\_CASH\_RECEIPT\_ID column with the CASH\_RECEIPT\_ID column for the receipt that was reversed. Oracle Receivables creates a new payment schedule record when you create a chargeback in the Receipts window. The ASSOCIATED\_CASH\_RECEIPT\_ID column is the cash receipt of the payment that you entered when you created the chargeback in this window.

The ACTUAL\_DATE\_CLOSED and GL\_DATE\_CLOSED columns are populated with the date of the latest transaction. The ACTUAL\_DATE\_CLOSED column gives the date that you applied a payment or credit to an open transaction that set the AMOUNT\_DUE\_REMAINING column to 0 for that transaction. Oracle Receivables uses the ACTUAL\_DATE\_CLOSED column to determine which transactions to include when you print statements. The GL\_DATE\_CLOSED column indicates the General Ledger date that your transaction was closed on. This column identifies which transactions Oracle Receivables selects when it displays current and overdue debit items in the aging reports. The aging reports also use the current balances in the AMOUNT\_DUE\_REMAINING column to display outstanding amounts for current and overdue debit items.

The primary key for this table is PAYMENT\_SCHEDULE\_ID, which identifies the transaction that created the row.

## Database Triggers

Trigger Name : AR\_PAYMENT\_SCHEDULES\_BRI  
 Trigger Time : BEFORE  
 Trigger Level : ROW  
 Trigger Event : INSERT

The AR\_PAYMENT\_SCHEDULES\_BRI trigger sets the GL\_DATE\_CLOSED and ACTUAL\_DATE\_CLOSED columns to a different value if these columns are left null.

Trigger Name : AR\_MRC\_PAYMENT\_SCHEDULES\_BIUD  
 Trigger Time : BEFORE  
 Trigger Level : ROW  
 Trigger Event : INSERT, UPDATE, DELETE

The AR\_MRC\_PAYMENT\_SCHEDULES\_BIUD trigger is an MRC trigger that only exists when you install the Multiple Reporting Currencies feature and is executed when you perform an insert, update, or delete statement on the AR\_PAYMENT\_SCHEDULES\_ALL table. For each record that is inserted, updated, or deleted in the AR\_PAYMENT\_SCHEDULES\_ALL table, this trigger inserts, updates, or deletes any corresponding reporting currency records in the AR\_MC\_PAYMENT\_SCHEDULES MRC subtable. This trigger also populates the MRC VARCHAR2 columns in the AR\_PAYMENT\_SCHEDULES\_ALL table.

Trigger Name : JL\_BR\_AR\_OCC\_DOCS\_DUE\_DATE\_CHG  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : UPDATE

The JL\_BR\_AR\_OCC\_DOCS\_DUE\_DATE\_CHG trigger inserts a new record in the JL\_BR\_AR\_OCCURRENCE\_DOCS\_ALL table after the DUE\_DATE column of the AR\_PAYMENT\_SCHEDULES\_ALL table is updated. This trigger is active only if Oracle Financials for the Americas is used.

Trigger Name : JL\_BR\_AR\_PAYMENT\_SCH\_GBL  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT

The JL\_BR\_AR\_PAYMENT\_SCH\_GBL trigger assigns values to the GLOBAL\_ATTRIBUTE8, GLOBAL\_ATTRIBUTE9, GLOBAL\_ATTRIBUTE11, and GLOBAL\_ATTRIBUTE\_CATEGORY columns when payment schedules are created in the AR\_PAYMENT\_SCHEDULES\_ALL table for a new transaction. This trigger is active only if Oracle Financials for the Americas is used.

Trigger Name : AR\_PAYMENT\_SCHEDULES\_BRU  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : UPDATE

The AR\_PAYMENT\_SCHEDULES\_BRU trigger inserts a record in the AR\_DISPUTE\_HISTORY table whenever the AMOUNT\_IN\_DISPUTE column is updated.

## AR\_PERIODS

The AR\_PERIODS table is a denormalized table that Receivables uses to improve performance in the AutoInvoice and Revenue Recognition programs. This table is populated from the GL\_PERIOD\_STATUSES table, and includes rows where the ADJUSTMENT\_PERIOD\_FLAG column in the GL\_PERIOD\_STATUSES table is N.

The NEW\_PERIOD\_NUM column stores the sequence of the period if ordered by accounting period start date within an accounting period type.

### Column Descriptions

## AR\_PERIOD\_TYPES

The AR\_PERIOD\_TYPES table contains the maximum number of days in a period within a type of period. For example, a fiscal month could be defined as having a maximum of 30 days. This table improves the performance of the AutoInvoice and Revenue Recognition programs.

### Column Descriptions

## AR\_POSTING\_CONTROL

The AR\_POSTING\_CONTROL table stores basic information about each batch of Oracle Receivables transactions that you transfer to either Oracle General Ledger or the GL\_INTERFACE table. Each row includes information about the transfer, such as the General Ledger start and end dates. Oracle Receivables creates one row in this table each time that you submit the posting process.

The value that you enter for the RUN\_GL\_JOURNAL\_IMPORT\_FLAG column using the Run GL Journal Import parameter in the Run General Ledger Interface window determines which concurrent processes Oracle Receivables submits during the transfer process. If you set the RUN\_GL\_JOURNAL\_IMPORT\_FLAG column to Y by entering Yes in the Run GL Journal Import field, Oracle Receivables ensures that only one transfer request is submitted at one time.

The AR\_POSTING\_CONTROL table corresponds directly to the fields in the Run General Ledger Interface window. When you submit the transfer process through this window, Oracle Receivables locks all transaction records that were not transferred, that have GL\_DATE values between the dates that you specify in the GL Start Date and GL End Date fields, and that have a null GL\_POSTED\_DATE column in the AR\_CASH\_RECEIPTS, AR\_MISC\_CASH\_DISTRIBUTIONS, AR\_RECEIVABLE\_APPLICATIONS, AR\_RATE\_ADJUSTMENTS, AR\_ADJUSTMENTS, RA\_CUSTOMER\_TRX, and RA\_CUST\_TRX\_LINE\_GL\_DIST tables. Oracle Receivables generates a unique identifier in the POSTING\_CONTROL\_ID column for this batch of transactions. For each untransferred record, the Update Posting Control concurrent program inserts this value into the POSTING\_CONTROL\_ID columns of these tables.

If you set the RUN\_GL\_JOURNAL\_IMPORT\_FLAG column to N by entering No in the Run Journal Import parameter, the transferred transaction records from these tables that are within the General Ledger date range that you specify remain in the GL\_INTERFACE table after they are loaded by the General Ledger Transfer program. Oracle Receivables uses these records to generate the Posting Execution report. Oracle Receivables also generates the Unposted Items report if there are items that you select for posting that are out of balance. The GLLEZL\_REQUEST\_ID column will be null because Oracle Receivables does not invoke the General Ledger Import program. You define the GL\_POSTED\_DATE column for these transactions through the GL Posted Date field in the Run General Ledger Interface window.

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

If you set the RUN\_GL\_JOURNAL\_IMPORT\_FLAG column to Y by entering Yes in the Run GL Journal Import parameter, Oracle Receivables transfers your batch of transaction entries to Oracle General Ledger via the GL\_INTERFACE table. The General Ledger Import program transfers your journal entries to the General Ledger table from the GL\_INTERFACE table. The GLLEZL\_REQUEST\_ID column stores the concurrent process request identifier of the General Ledger Import program that the General Ledger Transfer Program invokes after loading transaction records into the GL\_INTERFACE table. The STATUS column indicates whether Oracle Receivables has completed the transfer process for a batch or not.

When you transfer a batch of transactions to Oracle General Ledger, the GL\_JE\_BATCHES table stores the POSTING\_CONTROL\_ID for this batch as part of a concatenated value in its NAME column.

The primary key for this table is POSTING\_CONTROL\_ID.

## AR\_POSTING\_REPORT\_INTERIM

The AR\_POSTING\_REPORT\_INTERIM table contains posting cycle information that is summarized by category and currency.

The Posting Execution report uses this table, which is populated by the GL Transfer Program. The Posting Execution report first extracts information from the table, and then the GL Transfer program deletes table rows.

This table was created so that the Posting Execution report does not directly hit the GL\_INTERFACE table, as required for distributed applications.

The primary keys for this table are POSTING\_CONTROL\_ID, CURRENCY\_CODE, USER\_JE\_CATEGORY\_NAME, and CYCLE\_NUMBER.

## AR\_RATE\_ADJUSTMENTS\_ALL

The AR\_RATE\_ADJUSTMENTS\_ALL table stores information about currency exchange rate adjustments. Oracle Receivables lets you make adjustments to a receipt's rate, rate type, or rate date before or after posting to General Ledger. Receivables creates one row for each receipt that is adjusted.

Each rate adjustment creates two new sets of receipt applications. The first set of receipt applications reverses existing applications with the old rate, and the second set creates receipt applications with the new rate.

The primary key for this table is RATE\_ADJUSTMENT\_ID.

#### Database Triggers

Trigger Name : AR\_MRC\_RATE\_ADJUSTMENTS\_BI  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT

The AR\_MRC\_RATE\_ADJUSTMENTS\_BI trigger exists only when you install the Multiple Reporting Currencies feature and executes when you perform an insert, update, or delete statement on the AR\_RATE\_ADJUSTMENTS\_ALL table.

For each record that is inserted, updated, or deleted in the AR\_RATE\_ADJUSTMENTS\_ALL table, this trigger inserts, updates, or deletes corresponding reporting currency records in the AR\_MC\_RATE\_ADJUSTMENTS MRC subtable. In addition, this trigger populates the MRC VARCHAR2 columns in the AR\_RATE\_ADJUSTMENTS\_ALL table.

## AR\_RECEIPTS\_REP\_ITF

The AR\_RECEIPTS\_REP\_ITF table stores information for the RXi Receivables Receipts reports, which include the Applied Receipts Register, Receipt Forecast, and Receipt Register reports. These reports let you sort and display transactions in a custom format.

## AR\_RECEIPT\_CLASSES

The AR\_RECEIPT\_CLASSES table stores user-defined receipt classes. Receipt classes determine if receipts that are assigned to a receipt class are manually or automatically created and also indicate the required processing steps, such as confirmation, remittance, and clearance.

The primary key for this table is RECEIPT\_CLASS\_ID.

### Column Descriptions

# AR\_RECEIPT\_METHODS

The AR\_RECEIPT\_METHODS table stores information about payment methods, which are receipt attributes that you define and assign to receipt classes to account for receipts and their applications.

For automatically created receipts, a payment method defines the rules for creating these receipts. For manually created receipts, a payment method defines a user-definable receipt type.

Each payment method is associated with a set of bank accounts, which forms the set of bank accounts that can be assigned to a receipt. For example, if you normally receive Lockbox transmissions from bank ABC and bank DEF, you might create a Lockbox payment method and assign bank accounts from bank ABC and bank DEF to this payment method.

The primary key for this table is RECEIPT\_METHOD\_ID.

## AR\_RECEIPT\_METHOD\_ACCOUNTS\_ALL

The AR\_RECEIPT\_METHOD\_ACCOUNTS\_ALL table is an intersection of payment methods and bank accounts. For each receipt method, every bank account that can handle this payment method is defined as a row in this table. The accounting entries that are used for each step of the lifecycle of the receipt are also defined at this level, so they can vary by payment method and bank accounts.

The primary keys for this table are BANK\_ACCOUNT\_ID and RECEIPT\_METHOD\_ID.

## AR\_RECEIVABLES\_TRX\_ALL

The AR\_RECEIVABLES\_TRX\_ALL table links accounting information with your receivables activities. Use your receivables activities to speed receipt entry and generate finance charges. Possible types of activities include Adjustment, Miscellaneous Cash, and Finance Charge. If you select a Miscellaneous Cash activity type, you can associate either a distribution set or a standard accounting flexfield with your receivables activity. Oracle Receivables uses one row for each activity.

The primary key for this table is RECEIVABLES\_TRX\_ID.

## AR\_RECEIVABLE\_APPLICATIONS\_ALL

The AR\_RECEIVABLE\_APPLICATIONS\_ALL table stores all accounting entries for both your cash and credit memo applications. The APPLICATION\_TYPE column stores either CASH or CM (for credit memo applications). Each row in this table includes the amount applied, status, and accounting flexfield information.

Possible statuses of your applications include:

- APP – Applied
- UNAPP – Unapplied
- ACC – On-Account
- UNID – Unidentified

You use this information to determine the applications of your payments or credit memos. The status of a receivable application determines which flexfield account that Receivables uses. For example, if you enter a cash receipt of \$500 as Unidentified, Receivables creates a record in the AR\_RECEIVABLE\_APPLICATIONS\_ALL table with \$500 in the AMOUNT\_APPLIED column and UNID in the STATUS column. Receivables uses the CODE\_COMBINATION\_ID foreign key column to associate this payment with the Unidentified flexfield account. The CODE\_COMBINATION\_ID column stores valid Accounting Flexfield segment value combinations that are credited in General Ledger when this application is posted.

Cash applications represent cash receipt applications. The sum of the AMOUNT\_APPLIED column for cash applications should always equal the amount of the cash receipt. A negative value in the AMOUNT\_APPLIED column becomes a debit when this application is posted to General Ledger.

When a cash receipt is initially created, Receivables creates a row in this table for the cash receipt amount with a status of UNAPP. For each subsequent application, Receivables creates two rows: one row with a status of APP for the amount that is applied to the invoice, and one row with status of UNAPP for the negative of the amount that is applied.

If you reverse a cash application, Receivables creates two new rows: one row with status of APP for the original application's inverse amount (the negative of the original application amount), and one row with a status of UNAPP for the positive amount of the application that is reversed.

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

For example:

UNAPP \$100 Creation of a \$100 cash receipt  
    APP \$60 Application of \$60 of this cash receipt  
UNAPP -\$60 This row debits the Unapplied account  
    APP -\$60 Reversal of the \$60 application  
UNAPP \$60 This rows credits the Unapplied account

Credit memo applications, on the other hand, do not have rows with a status of UNAPP. Credit memo applications use only rows with a status of APP.

The CASH\_RECEIPT\_ID column stores the cash receipt ID of the receipt that you entered. Receivables concurrently creates a record for this receipt in the AR\_CASH\_RECEIPTS\_ALL table. This column is null for a credit memo application. The CUSTOMER\_TRX\_ID and PAYMENT\_SCHEDULE\_ID columns also identify the transaction that you are actually applying.

The APPLIED\_CUSTOMER\_TRX\_ID and APPLIED\_PAYMENT\_SCHEDULE\_ID columns identify the invoice or credit memo that receives the application.

For example, if you apply a receipt against an invoice, Receivables creates a record in the AR\_RECEIVABLE\_APPLICATIONS\_ALL table. The CASH\_RECEIPT\_ID and PAYMENT\_SCHEDULE\_ID columns for this record identify the receipt that you are applying. The APPLIED\_CUSTOMER\_TRX\_ID and APPLIED\_PAYMENT\_SCHEDULE\_ID columns for this record belong to the invoice that is receiving the application.

If you apply a credit memo against the invoice, Receivables creates a record in the AR\_RECEIVABLE\_APPLICATIONS\_ALL table. The CUSTOMER\_TRX\_ID and PAYMENT\_SCHEDULE\_ID columns for this record identify the credit memo that you are applying. The APPLIED\_CUSTOMER\_TRX\_ID and APPLIED\_PAYMENT\_SCHEDULE\_ID columns for this record belong to the invoice that is receiving the application.

If you combine an on-account credit and a receipt, Receivables creates a record in the AR\_RECEIVABLE\_APPLICATIONS\_ALL table. The CASH\_RECEIPT\_ID and PAYMENT\_SCHEDULE\_ID columns for this record identify the receipt. The APPLIED\_CUSTOMER\_TRX\_ID and APPLIED\_PAYMENT\_SCHEDULE\_ID columns for this record identify

the on-account credit that you are combining with the receipt.

The CONFIRMED\_FLAG column is a denormalization from the AR\_CASH\_RECEIPTS\_ALL table. If the cash receipt is not confirmed, the applications of that receipt are not reflected in the payment schedule of the transaction that the receipt is applied against.

The primary key for this table is RECEIVABLE\_APPLICATION\_ID, which uniquely identifies the transaction that created the row.

## Database Triggers

Trigger Name : AX\_AR\_RECEIVABLE\_APPL\_AR11  
 Trigger Time : AFTER  
 Trigger Level : ROW  
 Trigger Event : INSERT

The AX\_AR\_RECEIVABLE\_APPL\_AR11 trigger captures information that is needed to create subledger accounting events when the Set of Books that is used is defined as a Global Accounting Engine Set of Books for the Oracle Receivables application. This trigger captures accounting events related to Oracle Receivables cash receipt and credit memo applications and executes right after each row is created.

For a cash receipt, an application row is created when the cash receipt is created, applied, or reversed. For a credit memo, the application is created when the credit memo is applied to an invoice. This trigger may insert, update, or delete rows in the AX\_DOCUMENT\_STATUSES and AX\_EVENTS tables.

Trigger Name : AX\_AR\_RECEIVABLE\_APPL\_ARU1  
 Trigger Time : AFTER  
 Trigger Level : ROW  
 Trigger Event : UPDATE

The AX\_AR\_RECEIVABLE\_APPL\_ARU1 trigger captures information that is needed to create subledger accounting events when the Set of Books used is defined as a Global Accounting Engine Set of Books for the Oracle Receivables application. This trigger updates the unposted line count of the credit memo document as each Oracle Receivables credit memo application is posted, and fires right after a credit memo application is posted.

This trigger updates the AX\_DOCUMENT\_STATUSES table.

Trigger Name : AX\_AR\_RECEIVABLE\_APPL\_ARD1  
 Trigger Time : AFTER  
 Trigger Level : ROW  
 Trigger Event : DELETE

The AX\_AR\_RECEIVABLE\_APPL\_ARd1 trigger captures information that is needed to create subledger accounting events when the Set of Books used is defined as a Global Accounting Engine Set of Books for the Oracle Receivables application. This trigger maintains line count and unposted line count information related to Oracle Receivables credit memo applications in the AX\_DOCUMENT\_STATUSES table and fires right after a credit memo application is deleted.

This trigger updates the AX\_DOCUMENT\_STATUSES table.

Trigger Name : AR\_RECEIVABLE\_APPLICATIONS\_BRI  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT

The AR\_RECEIVABLE\_APPLICATIONS\_BRI trigger obtains the current value for the CASH\_RECEIPT\_HISTORY\_ID column during a cash receipt application.

Trigger Name : AR\_MRC\_RECEIVABLE\_APPS\_BIUD  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT, UPDATE, DELETE

The AR\_MRC\_RECEIVABLE\_APPS\_BIUD trigger is an MRC trigger that only exists when you install the Multiple Reporting Currencies feature. This trigger is executed when you perform an insert, update, or delete statement on the AR\_RECEIVABLE\_APPLICATIONS\_ALL table.

For each record that is inserted, updated, or deleted in the AR\_RECEIVABLE\_APPLICATIONS\_ALL table, this trigger inserts, updates, or deletes corresponding reporting currency records in the AR\_MC\_RECEIVABLE\_APPS MRC subtable. In addition, this trigger populates the MRC VARCHAR2 columns in the AR\_RECEIVABLE\_APPLICATIONS\_ALL table.

Trigger Name : JL\_BR\_AR\_OCC\_DOCS\_WRT\_N\_ABTMT1  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : INSERT

The JL\_BR\_AR\_OCC\_DOCS\_WRT\_N\_ABTMT1 trigger inserts a new record in the JL\_BR\_AR\_OCCURRENCE\_DOCS\_ALL table after a credit is applied or reapplied to a payment schedule which is in the bank to be collected. This trigger fires after an insert on the AR\_RECEIVABLE\_APPLICATIONS\_ALL table. This trigger is active only if Oracle Financials for the Americas is used.

## AR\_REVENUE\_ADJUSTMENTS\_ALL

The AR\_REVENUE\_ADJUSTMENTS\_ALL table stores all information about revenue adjustments on transactions for online query, audit, and reporting.

The primary key for this table is REVENUE\_ADJUSTMENT\_ID.

# AR\_SALES\_TAX

The AR\_SALES\_TAX table stores compiled sales tax rates for each taxing authority that is defined in Oracle Receivables. Multiple sales tax rates, distinguished by postal code and effective date range, may be associated with a single taxing authority.

Only database triggers that are associated with the AR\_LOCATION\_RATES and AR\_LOCATION\_COMBINATIONS tables can create records in this table. The AR\_LOCATION\_RATES table is the source for all sales tax rates. Any records that are created in this table are automatically compiled into the composite rate, provided that every segment has overlapping postal code and effective date ranges.

This table improves the performance of the Oracle Receivables sales tax rate calculation program that is used during invoice line creation.

The primary keys for this table are LOCATION\_ID, ENABLED\_FLAG, START\_DATE, END\_DATE, FROM\_POSTAL\_CODE, and TO\_POSTAL\_CODE.

## AR\_SALES\_TAX\_REP\_ITF

The AR\_SALES\_TAX\_REP\_ITF table stores information for the RXi US Sales Tax report. This report lets you sort and display your periodic sales tax return information in a custom format and integrate with a third party tax preparation program to generate your tax returns.

## AR\_SELECTION\_CRITERIA

The AR\_SELECTION\_CRITERIA table is a bills receivable-specific table that contains the selection criteria that are used by different parts of the bills receivable process. For example, the AR\_SELECTION\_CRITERIA table stores the criteria that the Bills Receivable Batch Creation concurrent program uses to determine which transactions to include in a new bill receivable.

The primary key for this table is SELECTION\_CRITERIA\_ID.

## AR\_STANDARD\_TEXT\_B

The AR\_STANDARD\_TEXT\_B table stores information for standard statement messages. Oracle Receivables creates one row in this table for each statement message. Define standard messages to provide the text that Receivables prints on the bottom of your customer's statements. You can use messages to inform your customers of special promotions or to make your statements more personal. Messages that are stored in this table display as list of values choices in the Print Statements window.

The primary key for this table is STANDARD\_TEXT\_ID.

## AR\_STATEMENTS\_HISTORY\_ALL

The AR\_STATEMENTS\_HISTORY\_ALL table stores the history of every customer statement that was generated. Oracle Receivables uses this information to review customer statements in the Correspondence window of the Collections Workbench. The Statements Generation program (ARXSGP) populates this table.

## AR\_STATEMENT\_CYCLES

The AR\_STATEMENT\_CYCLES table stores general information about how often you send customer statements. Oracle Receivables uses statement cycles to determine when to send a statement to a customer. Statement cycles display as list of values choices in the Customer Profiles and Print Statements windows.

You enter statement dates in the AR\_STATEMENT\_CYCLE\_DATES\_ALL table and statement intervals in the AR\_STATEMENT\_CYCLE\_INTERVALS table.

The primary key for this table is STATEMENT\_CYCLE\_ID.

## AR\_STATEMENT\_CYCLE\_DATES\_ALL

The AR\_STATEMENT\_CYCLE\_DATES\_ALL table stores the dates that you specify for a statement cycle to automatically generate statements for all customers who are assigned to this statement cycle.

Statement cycle dates display as list of values choices in the Print Statements window. Receivables creates one row in this table for each date that you enter. The AR\_STATEMENT\_CYCLES table contains general information about each statement cycle.

The primary key for this table is STATEMENT\_CYCLE\_DATE\_ID.

# AR\_STATEMENT\_CYCLE\_INTERVALS

The AR\_STATEMENT\_CYCLE\_INTERVALS table stores information about your statement cycle intervals. Oracle Receivables uses these intervals as list of values choices in the Statement Cycles window. Valid intervals include weekly, monthly, and quarterly intervals.

The primary key for this table is INTERVAL\_NAME.

Column Descriptions

Name	Null?	Type	Description
INTERVAL_NAME (PK)	NOT NULL	VARCHAR2(30)	Name of the interval
LOW_DAY	NOT NULL	NUMBER	First date when the interval is active

## AR\_STATEMENT\_HEADERS

The AR\_STATEMENT\_HEADERS table is an interim table that Oracle Receivables uses when generating statements. The Print Statements program uses this table to store one row for each statement that the program will eventually produce. Each row is distinguished by a bill-to site and currency combination.

The primary keys for this table are SEND\_TO\_ADDRESS\_ID and CUSTOMER\_ID.

TAX_HIER_ACCOUNT_EXC_RATE	NULL	NUMBER(15)	Indicates tax code defaulting hierarchy for a revenue account tax code
TAX_HIER_SYSTEM_EXC_RATE	NULL	NUMBER(15)	Indicates tax code defaulting hierarchy for the System Option tax code
TAX_ENFORCE_ACCOUNT_FLAG	NULL	VARCHAR2(1)	Indicates if the tax code that is associated with a revenue account must be used at the invoice line
TAX_DATABASE_VIEW_SET	NULL	VARCHAR2(30)	Indicates the tax view set suffix. For example, A for Taxware, V for Vertex, O for Oracle tax views.
INCLUSIVE_TAX_USED	NULL	VARCHAR2(1)	If Y, the running totals in the Transactions Workbench Lines window are disabled
CODE_COMBINATION_ID_ROUND	NULL	NUMBER(15)	Code combination ID for the rounding error
TRX_HEADER_LEVEL_ROUNDING	NOT NULL	VARCHAR2(1)	Indicates if Header Level Rounding is enabled
TRX_HEADER_ROUND_CCID	NULL	NUMBER(15)	Code combination identifier of the header rounding account
FINCHRG_RECEIVABLES_TRX_ID	NULL	NUMBER(15)	Foreign key to the AR_RECEIVABLES_TRX table, indicates the default receivables activity for finance charges
SALES_TAX_GEOCODE	NULL	VARCHAR2(30)	US state and local tax jurisdiction code. Use this field to provide either a Vertex GeoCode or Taxware Geocode value for the Point of Order origin.
BILLS_RECEIVABLE_ENABLED_FLAG	NULL	VARCHAR2(1)	Bills Receivable enabled flag
TA_INSTALLED_FLAG	NULL	VARCHAR2(1)	Trade Accounting activation flag
REV_TRANSFER_CLEAR_CCID	NULL	NUMBER(15)	Code combination ID of clearing account for revenue transfers

## AR\_TAX\_CONDITIONS\_ALL

The AR\_TAX\_CONDITIONS\_ALL table stores information about tax condition sets, which are user-defined expressions that indicate one or more conditions that each tax code within a tax group is dependent on. You can specify one or more actions for each tax condition set.

For example, you can use tax condition sets to control when a tax code is used within a tax group, when exceptions are applied to a tax code, and what requirements must be satisfied before Receivables can use a tax group. Tax conditions consist of one or more expressions, and one or more actions.

The primary key for this table is TAX\_CONDITION\_ID.

## AR\_TAX\_EXTRACT\_DCL\_ITF

The AR\_TAX\_EXTRACT\_DCL\_ITF declarations subinterface table is populated by the Tax Reporting Ledger Tax Extract program. The Tax Reporting Ledger provides a single reporting solution for the complex global tax requirements on sales and purchases and lets you summarize tax information from Oracle Receivables, Oracle Payables, and Oracle General Ledger. The Tax Extract program extracts the accounting information from each application. This table stores information about the extracted reporting and legal entities, such as tax registration number and address. One record exists for each combination of organization ID and balancing segment.

You can use any reporting tool such as RXi and Application Desktop Integrator (ADI) to specify which fields of the Tax Reporting Ledger to include and print the report in a format that meets your needs.

The primary key for this table is TAX\_EXTRACT\_DECLARER\_ID.

### Column Descriptions

## AR\_TAX\_GROUP\_CODES\_ALL

The AR\_TAX\_GROUP\_CODES\_ALL table identifies tax codes in a tax group. Tax groups are a schedule of multiple, conditional taxes. When a tax group is assigned to a transaction line, Oracle Receivables automatically uses each of the applicable tax codes based on the condition rules that are set up in the AR\_TAX\_GROUP\_CONDITIONS table.

The primary key for this table is TAX\_GROUP\_CODE\_ID.

# AR\_TAX\_INTERFACE

The AR\_TAX\_INTERFACE table is used to import location, postal code, and sales tax rate information into Oracle Receivables. You insert rows in this table and then use the Sales Tax Interface program to create records in the AR\_LOCATION\_VALUES and AR\_LOCATION\_RATES tables.

Each row can define a new location, and you can assign multiple postal code and effective date ranges to the location. Each range might have an optional sales tax rate, expressed with multiple rows in the AR\_TAX\_INTERFACE table.

The Sales Tax Interface program validates rows in the AR\_TAX\_INTERFACE table as the program loads or updates records in the AR\_LOCATION\_VALUES and AR\_LOCATION\_RATES tables. Sample SQL\*Loader control files are defined in the Oracle Receivables BIN directory for different vendors of US Sales Tax jurisdictions and rates.

The primary key for this table is INTERFACE\_LINE\_ID.

## AR\_TA\_ASGN\_TO\_INT\_ALL

AR\_TA\_ASGN\_TO\_INT\_ALL is an interface table used to store details about all salespersons and collectors. This table can be used by any external Deduction Management System to ensure synchronization of customer information with Trade Accounting. On every run of the ?Transfer assigned to? process, this table is flushed and a fresh row is inserted for each salesrep and collector.

# AR\_TA\_CASHAPP\_OB\_ALL

This table stores the current open balance of all transactions processed by the Cash Engine for a transmission, and is used by the Cash Engine and Matching Rules modules. The Cash Engine module stores the current open balance of all the transactions it processes. The Matching Rules pick up the open balance of a transaction from this table. During processing, when a rule tries to find the open balance of a transaction, it searches this table first. If it does not find it only then it uses the open balance as stored in the Payments Schedule table. The Cash Engine modifies the current balance of the transaction based on the potential applications of a transaction. Note: This table is required since there may be several applications to a transaction in a batch which are processed on an individual basis. The contents of this table are deleted after the entire transmission has been processed.

Column Descriptions

Name	Null?	Type	Description
PAYMENT_SCHEDULE_ID (PK)	NOT NULL	NUMBER(15)	The payment schedule identifier of the transaction being processed. This is used to identify a transaction.
TRANSMISSION_REQUEST_ID (PK)	NOT NULL	NUMBER(15)	The transmission request identifier for the batch which the Cash Engine is processing
BATCH_NAME	NOT NULL	VARCHAR2(25)	The batch name
CURRENT_OPEN_BALANCE	NOT NULL	NUMBER	The current open balance of the transaction
ORG_ID	NULL	NUMBER	Organization identification

## AR\_TA\_CUST\_INT\_ALL

AR\_TA\_CUST\_INT\_ALL is an interface table used to store details about all customers. This table can be used by any external Deduction Management System to ensure synchronization of customer information with Trade Accounting. On every run of the ?transfer customers? process, this table is flushed and a fresh row is inserted for each customer site address.

## AR\_TA\_CUST\_TRXSTR\_ALL

AR\_TA\_CUST\_TRXSTR\_ALL stores the link between original deductions and split or merged deductions. Every deduction originated from a split has a record in this table. Every deduction that is merged also has a record in this table. For a split record, CUSTOMER\_TRX\_ID represents the split deductions and CUSTOMER\_TRX\_PARENT\_ID represents the original deduction. For a merge record, CUSTOMER\_TRX\_ID represents the original deductions and CUSTOMER\_TRX\_PARENT\_ID represents the merged deductions.

### Column Descriptions

## AR\_TA\_PROMOTIONS\_ALL

AR\_TA\_PROMOTIONS\_ALL stores the promotional data. By recording the promotional program and pertinent information (customer, date range, products eligible, allowances, amount committed to customer, committed sales amount, etc.) this table enables you to identify deductions received, re-define, and possibly re-bill those deductions. Any data stored in legacy systems has to be loaded into the Oracle Receivables to provide the ability to review, maintain and track the promotional plans at the customer level. Data from a legacy system must be sent in the form of a flat file for the import program to read and insert into the interface tables, and so the validation program can validate and transfer the data into destination tables. This can be done by submitting the appropriate Request Sets.

## AR\_TA\_PROM\_CUST\_ALL

AR\_TA\_PROM\_CUST\_ALL contains the Oracle customers corresponding to the Legacy customers in the imported Promotion. Usually in legacy promotion systems, the customer is defined as a Retailed Market Area (RMA). Each RMA defined in a Legacy system may correspond to multiple different customers in Oracle Financials; thus a Promotion with one RMA? when imported to Oracle Financials? could represent multiple customers

## AR\_TA\_PROM\_LINES\_INT

AR\_TA\_PROM\_LINES\_INT contains line details of the promotion information from other applications. The lines could be product details, payment (allowance) details, and customer details. The lines data is temporarily stored in this table until it is validated and transferred into respective destination tables. Note: Usually in legacy promotion systems, the customer is defined as a Retailed Market Area (RMA). Each RMA defined in a Legacy system may correspond to multiple different customers in Oracle Financials; thus a Promotion with one RMA? when imported to Oracle Financials? could represent multiple customers.

## AR\_TA\_PROM\_PRODS\_ALL

AR\_TA\_PROM\_PRODS\_ALL stores the product details of the promotion. This table records the product details of the product group ID that was assigned to the promotion. When Legacy data is imported into Trade Accounting, the records with record type 2 are loaded into this table.

### Column Descriptions

Name	Null?	Type	Description
PROMOTION_ID	NOT NULL	NUMBER(15)	Promotion unique identifier
PROMOTION_PRODUCT_GROUP_ID	NOT NULL	VARCHAR2(15)	The product group unique identifier

## AR\_TA\_PROM\_STATUS\_MAP

AR\_TA\_PROM\_STATUS\_MAP contains the mapping of the Promotion Status defined in the Legacy system with that defined in Oracle Financials. There should be at least one record with the Oracle status defined as ?DELETE?.

### Column Descriptions

Name	Null?	Type	Description
LEGACY_STATUS_ID	NOT NULL	NUMBER(15)	The unique identifier of the status in Legacy system
LEGACY_STATUS_NAME	NOT NULL	VARCHAR2(15)	The name of the status in the legacy system

## AR\_TA\_RECV\_TRXSET\_ALL

AR\_TA\_RECV\_TRXSET\_ALL stores the association of Transaction sets with the Receivable accounts. This association is utilized when deductions or UCD transactions are created against an invoice. Since the invoices have a specific receivable account assigned, the association of Transaction set with the Receivable account determines the usage of transaction types while creating deductions or UCDs against an invoice.

## AR\_TA\_REMIT\_HIST\_ALL

This table contains the application details of all Receipts and Receipts lines processed by the Cash Engine. It also contains the application details of all records when deductions are created from the Receipts Workbench. It stores five types of records, namely, Receipts (Record type 5), Receipt Lines (Record type 6), Deduction Transactions (Record type 7), Balancing Transactions (Record type 8), and Write Off Adjustments (Record type 9). The relationship between these transactions are as follows :

A Receipt may have more than one Receipt line. An application on a Receipt Line shall generate one or more deductions (maximum of 2 : Normal Deduction and Unearned Cash Discount Deduction) and one or more balancing transactions (a balancing transaction corresponding to each deduction).

Each Deduction may be written off and hence may have one Write- off Adjustment. Different information is populated for each record type. For example, the rule\_ identifier column is populated only for record type 6 but not for any other record types. Similarly, the profile\_ identifier column is populated for record types 5 and 6 but not for any other record types. However, note that these values may be different; i. e. the profile for the receipt record may be different than the profile of a receipt line record. The relationship between Receipts and Receipt lines is done through the item\_ number column. For a given transmission and batch, the item number of a Receipt is unique. The value of this column is populated for record type 5 and record type 6.

The relationship between receipt lines and its deductions and balancing transaction is done through the history\_ line\_ identifier and the parent\_ history\_ line\_ identifier columns; i. e. the value of the history\_ line\_ identifier column for a receipt line is equal to the value of the parent\_ history\_ line\_ identifier column for its corresponding deductions and balancing transactions.

Similarly the relationship between deductions and write- off adjustments is also done through the history\_ line\_ identifier and parent\_ history\_ line\_ identifier columns. The column payment\_ type indicates the various categories of payments, and can have the following values :

EARNED DISC

Indicates that a match has been found for the receipt line and an earned

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

discount and/ or an unearned discount was computed.

#### UNEARNED DISC

Indicates that a match has been found for the receipt line and an that only an unearned discount was computed.

#### NO DISC

Indicates that a match has been found for the receipt line and neither an earned discount or an unearned discount was applicable.

#### PROMOTIONS

Indicates that a promotion match has been identified for the receipt line.

#### NO MATCH

Indicates that no matches has been found for the receipt line. The column event\_ type indicates whether the event was an overpayment, an underpayment or an exact match. It could have the following values:

##### OP

Indicates overpayment. This is when the amount on receipt line is greater than the net amount of the transaction. In case of No Match situations an overpayment occurs if the receipt line amount is greater than zero.

##### UP

Indicates underpayment. This is when the amount on receipt line is less than the net amount of the transaction. In case of No Match situations an underpayment occurs if the receipt line amount is less than zero.

##### EM

Indicates exact match i. e. the receipt line amount is equal to the net amount of the matched transaction.

The column ucd\_ event\_ type indicates whether in addition to the event\_ type, an Unearned Cash Discount situation existed (The Cash Engine processes UCD?s separately). It can have the following values:

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

EM

Indicates exact match of the short payment with the computed unearned discount.

UU

Indicates UCD underpayment

*Column Descriptions*

Name	Null?	Type	Description
HISTORY_LINE_ID (PK)	NOT NULL	NUMBER(15)	This is the primary key and uniquely identifies a row in this table.
REQUEST_ID	NULL	NUMBER(15)	Transaction type identification
PROGRAM_APPLICATION_ID	NULL	NUMBER(15)	Application identifier of last concurrent program to update this record.
PROGRAM_ID	NULL	NUMBER(15)	Concurrent program that last updated row.
PROGRAM_UPDATE_DATE	NULL	DATE	Last date changed by concurrent program.
CREATED_BY	NULL	NUMBER(15)	Standard Who column
CREATION_DATE	NULL	DATE	Standard Who column
LAST_UPDATED_BY	NULL	NUMBER(15)	Standard Who column
LAST_UPDATE_DATE	NULL	DATE	Standard Who column
LAST_UPDATE_LOGIN	NULL	NUMBER(15)	Standard Who column
BATCH_NAME	NULL	VARCHAR2(25)	The name of the batch in the transmission. Updated for all record types.
CUSTOMER_ID	NULL	NUMBER(15)	The customer of the receipt (for record type 5) or the customer of the matched transaction (for record type 6).
CHECK_NUMBER	NULL	VARCHAR2(30)	The receipt number. Updated for record type 5 and 6.
REMITTANCE_AMOUNT	NULL	NUMBER	The check/ receipt amount. Updated for record type 5 and 6.
TRX_NUMBER	NULL	VARCHAR2(30)	The transaction number as given in the receipt line details Updated for record type 6.
TRX_AMOUNT	NULL	NUMBER	The receipt line amount as given in the receipt line details Updated for record type 6.
CUSTOMER_REF_NUMBER	NULL	VARCHAR2(30)	The transaction number against which a match was found. Updated or record type 6. This is used in the application details screen.
MATCHED_TRX_NUMBER	NULL	VARCHAR2(30)	The transaction number to be applied to the receipt. Updated for record type 6.
MATCHED_TRX_ID	NULL	NUMBER	The customer trx identifier of the applied transaction. Updated for record type 6.

Column Descriptions (Continued)

Name	Null?	Type	Description
MATCHED_TRX_TYPE	NULL	VARCHAR2(30)	The transaction type of the applied transaction. Updated for record type 6.
AMOUNT_APPLIED	NULL	NUMBER	The amount to be applied for the receipt line to the receipt. Updated for record type 6.
DISCOUNT_AMT	NULL	NUMBER	The earned discount computed for the matched transaction. Updated for record type 6.
NEW_TRX_ID	NULL	NUMBER	The customer trx identifier for the deduction/ balancing transaction. Updated for record type 7 and 8.
NEW_TRX_TYPE	NULL	VARCHAR2(30)	The transaction type of the new transaction. Updated or record type 7 and 8.
AMOUNT	NULL	NUMBER	The open balance of the applied transaction. Updated for record type 6. It is also updated for record types 7,8 where it indicates the amount for the new transaction.
PARENT_HISTORY_LINE_ID	NULL	NUMBER	The history line identifier of the parent. Updated for record types 7,8,9. For 7 and 8 it contains the history line identifier of record type 6. For record type 9 it contains the history line identifier for record type 7.
RULE_PROCEDURE	NULL	VARCHAR2(50)	Contains the name of the matching rule procedure used for matching. This is updated for record type. For no match cases this is null.
RULE_PROCESS	NULL	VARCHAR2(20)	Obsolete in 2. 3 upwards.
CUSTOMER_BANK_ACCOUNT_ID	NULL	NUMBER	The bank account of receipt customer. Updated for record type 6.
TRANSMISSION_REQUEST_ID	NULL	NUMBER	The transmission request identifier of the transmission. Updated for all record types.
ORG_ID	NULL	NUMBER	
RECORD_TYPE	NULL	NUMBER	Values are 5,6,7,8, 9. Updated for all records.
ORGANISATION_SEG	NULL	VARCHAR2(30)	The value of the organization. Updated for record type 5, 6.
CUSTOMER_SEG	NULL	VARCHAR2(30)	The customer number. Updated for record type 5 and 6. Note that values may be different as the receipt customer may be different from the customer as found from the transaction of the receipt line.
LOB_SEG	NULL	VARCHAR2(30)	The value of the line of business. Updated for record type 6. Shall be null for no match cases.
FLEX_SEG	NULL	VARCHAR2(30)	The value of the flex. Updated for record type 6. Shall be null for no match cases

Name	Null?	Type	Description
PROFILE_ID	NULL	NUMBER	The profile identifier of the receipt or receipt line. Updated for record types 5 and 6. Values for 5 and 6 may differ.
RULE_SET_ID	NULL	NUMBER	The he Rule set identifier used. Updated for record type 6,7,8. This points uniquely to a row of the rule set table.
TRX_SET_ID	NULL	NUMBER	The transaction set identifier used; updated for record type 6,7,8. This points uniquely to a row of the transaction set table.
PAYMENT_TYPE	NULL	VARCHAR2(20)	The payment type. Values discussed above. Updated for record type 6.
EVENT_TYPE	NULL	VARCHAR2(2)	The event type. Values discussed above. Updated for record type 6.
UCD_EVENT_TYPE	NULL	VARCHAR2(2)	The UCD event type. Values discussed above. Updated for record type 6.
PROMOTION_NUMBER	NULL	VARCHAR2(30)	The promotion number with which a match was found. This is populated only when there is a promotion match. Updated for record type 6.
ADJUSTMENT_TOLERANCE	NULL	NUMBER	This is the write- off threshold value. Updated for record type 9.
ADJUSTMENT_ACTIVITY_ID	NULL	NUMBER(15)	This is the receivables activity identifier for the write- off adjustment. Updated for record type 9.
ADJUSTMENT_ID	NULL	NUMBER(15)	The identifier of the write- off adjustment. Updated or record type 9.
ADJUSTMENT_NUMBER	NULL	VARCHAR2(20)	The number of the write- off adjustment. Updated for record type 9.
ADJUSTMENT_STATUS	NULL	VARCHAR2(30)	The status of the adjustment. Updated for record type 9.
CREATED_FROM	NULL	VARCHAR2(30)	This may have values of 'CASH_ENGINE' (for applications from Cash Engine) and 'MANUAL' ( for applications from Receipts Workbench for only those applications for which deductions were manually created ). Updated for all records.
CURRENCY_CODE	NULL	VARCHAR2(15)	The currency code of the receipt. This is updated for record types 5 and 6. Both have same values.
RULE_ID	NULL	NUMBER(9)	The identifier of the rule used. Updated for record type 6.
CASH_RECEIPT_ID	NULL	NUMBER(15)	The identifier for the receipt. Updated for record types 5,6.
LOCKBOX_NUMBER	NULL	VARCHAR2(30)	The Lockbox number for the transmission. Updated for record types 5,6.

# AR\_TA\_REMIT\_PROF\_ALL

AR\_TA\_REMIT\_PROF\_ALL is a setup table which sets the parameters for the customers remittance processing. This is mainly used by the Cash Engine, the matching rule and the discount calculation procedures. It sets the discount basis and various grace days (from apply, postmark and deposit dates) for the calculation of discount. The field full\_discount\_flag sets whether or not to give the full discount on the gross amount, even though any percentage of the gross amount has been paid down. The columns discount, finance\_charg\_flag and items\_on\_dispute\_flag are used to calculate the open balance according to whether only the earned discount is subtracted, the finance charge is added or not, and/ or the items on dispute have been added. The matching rule set in this table is used by the matching rule procedure to identify in which order, or in which way the receipt should be matched against a transaction. For the Cash Engine procedure, the columns matched underpay rule, matched overpay rule, unmatched positive amount and unmatched negative amount are used to create transactions for these situations. The amounts of under and overpayment are used by the Cash Engine to write off the amounts without further approval. The default\_transaction\_set\_identifier column is used by the Cash Engine to created predefined transaction types in case adjustments.

## AR\_TA\_RULE\_SETS\_ALL

AR\_TA\_RULE\_SETS\_ALL contains the details of the rule sets that you define in Trade Accounting and subsequently attach to your profile definition. When the Cash Engine identifies a profile, it picks up the rule set you have attached to the profile and retrieves the details of all the rules it needs to apply. The details of the rules which are included in the rule set are contained in the CPGR\_RULE\_SET\_LINES table, which is a detail table of the CPGR\_RULE\_SETS table .

## AR\_TA\_TRX\_SETS\_ALL

AR\_TA\_TRX\_SETS\_ALL contains the details of the transaction sets that you define in Trade accounting. The Transaction sets contain a set of transaction types that the Cash Engine creates based on a situation. You attach a default transaction set to your profile definition. When the Cash Engine tries to create a deduction or balancing transaction, it identifies the transaction set to be used and uses it to pick up the transaction types from the AR\_TA\_TRX\_SET\_LN\_ALL table, which is a detail table of the AR\_TA\_TRX\_SETS\_ALL table.

## AR\_TA\_TRX\_TO\_CREATE

The AR\_TA\_TRX\_TO\_CREATE table contains information for the transactions which the Cash Engine needs to create based on various situations. The situations are characterized by a payment type and an event type. When the Cash Engine processes a receipt line of a receipt, it first tries to match the transaction number, promotion numbers, and purchase order numbers specified on the receipt line with that in the database using the matching rules. The matching rules compute the discount for the matched transaction to obtain the net payment required for the transaction. The Payment type can have the following values:

**EARNED DISC** – Indicates that a match has been found for the receipt line and an earned discount and/ or an unearned discount was computed.

**UNEARNED DISC** – Indicates that a match has been found for the receipt line and an that only an unearned discount was computed.

**NO DISC** – Indicates that a match has been found for the receipt line and neither an earned discount or an unearned discount was applicable.

**PROMOTIONS** – Indicates that a promotion match has been identified for the receipt line.

**NO MATCH** – Indicates that no matches has been found for the receipt line. The event type indicates the kind of event for a payment type: whether or not the event was an overpayment, an underpayment or an exact match. It can have the following values:

**OP** – Indicates overpayment. This is when the amount on receipt line is greater than the net amount of the transaction. In case of No Match situations an overpayment occurs if the receipt line amount is greater than zero.

**UP** – Indicates underpayment. This is when the amount on receipt line is less than the net amount of the transaction. In case of No Match situations an underpayment occurs if the receipt line amount is less than zero.

**EM** – Indicates exact match, i. e., the receipt line amount is equal to the net amount of the matched transaction.

**UU** – Indicates an underpayment. This is similar to UP except for the

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

fact that UU occurs only when the matched transaction has an unearned discount which is less than or equal to the short payment. The information on transactions to be created are based on the `trx_class` column of this table. This column can have the following values:

CM\_ OP – This is the deduction transaction to be created (credit memo) in case of overpayment.

DM\_ OP\_ BAL – This is the balancing transaction to be created (debit memo) in case of overpayment.

DM\_ UP – This is the deduction transaction to be created (debit memo) in case of underpayment.

CM\_ UP\_ BAL – This is the balancing transaction to be created (credit memo) in case of underpayment.

DM\_ UCD – This is the deduction transaction to be created (debit memo) in case of a UCD underpayment.

CM\_ UCD\_ BAL – This is the balancing transaction to be created (credit memo) in case of a UCD underpayment.

CM\_ UP\_ PROM – This is the balancing transaction to be created in case of Promotion match. Note: whenever a deduction is created a balancing transaction is also created; the only exception is in case of promotions. For promotions, only a balancing transaction is created; and instead of creating a deduction transaction, the promotion amount is reduced. The deduction transaction is created first and then the balancing transaction is created. When the Cash Engine creates transactions (deduction or balancing) it uses the sequence number (1 or 2) stored in the `SEQUENCE` column to determine if the transaction is a deduction or a balancing transaction.

Column Descriptions

PAYMENT_TYPE (PK)	NOT NULL	VARCHAR2(20)	The payment type.
EVENT_TYPE (PK)	NOT NULL	VARCHAR2(2)	The event type.
TRX_CLASS (PK)	NOT NULL	VARCHAR2(20)	The class type of the transaction that needs to be created.
SEQUENCE	NOT NULL	NUMBER	The sequence in which the transactions need to be created.

## AR\_TA\_TRX\_TYP\_INT\_ALL

AR\_TA\_TRX\_TYP\_INT\_ALL is an interface table used to store details about all transaction types. This table can be used by any external Deduction Management System (DMS) to ensure synchronization of DMS reason codes with transaction type information in Trade Accounting. On every run of the "transfer transaction types" process, this table is flushed and a fresh row is inserted for transaction type.

## AR\_TRANSACTION\_HISTORY\_ALL

The AR\_TRANSACTION\_HISTORY\_ALL table is a Bills Receivable table that contains detailed information about each bills receivable transaction, including activities and the lifecycle of bills receivable events. Oracle Receivables creates a new row each time there is activity on the bills receivable transaction, such as a payment or endorsement, or when the status of the bills receivable transaction changes, such as when a bill is completed or accepted. This table also stores the header for Oracle Receivables posting information.

The primary key for this table is TRANSACTION\_HISTORY\_ID.

### Column Descriptions

Name	Null?	Type	Description
TRANSACTION_HISTORY_ID (PK)	NOT NULL	NUMBER(15)	Unique identifier for transaction history
CUSTOMER_TRX_ID	NOT NULL	NUMBER(15)	Identifies the transaction that this history row relates to

## AR\_TRANSMISSIONS\_ALL

The AR\_TRANSMISSIONS\_ALL table stores information about each Lockbox transmission. Each row includes the original transmission request ID, the transmission date, time, count, and amount. Use this information to review the status of your transmissions. Possible statuses include New, Out of Balance, and Closed, stored as NEW, OOB, and CL.

The primary key for this table is TRANSMISSION\_REQUEST\_ID.

## AR\_TRANSMISSION\_FORMATS

The AR\_TRANSMISSION\_FORMATS table stores information about the Lockbox transmission formats that you define, such as format name and creation date. You define transmission formats so that Oracle Receivables can interpret your bank files. Each row includes the format name and description.

The primary key for this table is TRANSMISSION\_FORMAT\_ID.

## AR\_TRANS\_FIELD\_FORMATS

The AR\_TRANS\_FIELD\_FORMATS table stores information about each field in a transmission format. You specify the records that are part of each transmission format. Each record has specific field types that are stored in this table. Each row includes field starting position, field ending position, description, and justification information.

The primary key for this table is FIELD\_FORMAT\_ID.

## AR\_TRANS\_RECORD\_FORMATS

The AR\_TRANS\_RECORD\_FORMATS table stores information about each record in a transmission format, such as the record identifier, description, and the transmission format ID. You specify the records that are a part of each transmission format, and Oracle Receivables stores this information in this table.

The primary key for this table is RECORD\_FORMAT\_ID.

## AR\_VAT\_TAX\_ALL\_B

The AR\_VAT\_TAX\_ALL\_B table contains tax codes that are defined in the Tax Codes and Rates window. Each row represents a tax code and a tax rate valid for the period between the START\_DATE and the END\_DATE columns. For example, if you define a VAT code with a 10% rate, the TAX\_RATE column would store 10.

The primary keys for this table are TAX\_CODE and START\_DATE.

Column Descriptions (Continued)

Name	Null?	Type	Description
DISPLAYED_FLAG	NULL	VARCHAR2(1)	Controls if this tax code can be selected using the list of values to choose a tax code or tax group. By default, all tax groups and all tax codes that are not used within a tax group are displayed.
ENABLED_FLAG	NULL	VARCHAR2(1)	Indicates if the tax code is enabled. Y for enabled. N for not enabled. This column works with the START_DATE and END_DATE columns to enable or disable tax codes, even for a start date that is specified in the START_DATE column.
TAX_CONSTRAINT_ID	NULL	NUMBER(15)	Identifies a condition set used to optionally validate the tax group for any transaction line. Tax conditions ensure that a tax group has all required taxes and raise a user error message if a required tax is not used. This column is a foreign key to AR_TAX_CONDITIONS_ALL.TAX_CONDITION_ID.

## AR\_VAT\_TAX\_ALL\_TL

The AR\_VAT\_TAX\_ALL\_TL table provides multilingual support (MLS) for each tax code that you define in the Tax Codes and Rates window. MLS lets you store and print data that you define in multiple languages. For example, if you define a tax code in Spanish, the LANGUAGE column stores the code for Spanish.

The primary keys for this table are VAT\_TAX\_ID and LANGUAGE.

## Oracle Receivables Applications Technical Reference Manual, Volume 1 A89884–01

Oracle Corporation welcomes your comments and suggestions on the quality and usefulness of this publication. Your input is an important part of the information we use for revision.

- Did you find any errors?
- Is the information clearly presented?
- Do you need more information? If so, where?
- Are the examples correct? Do you need more examples?
- What features did you like most about this manual? What did you like least about it?

If you find any errors or have any other suggestions for improvement, please indicate the topic, chapter, and page number below:

This Technical Reference Manual (TRM) in any form, software or printed matter, contains proprietary information of Oracle Corporation; it is provided under an Oracle Corporation agreement containing restrictions on use and disclosure and is also protected by copyright, patent, and other intellectual property law. Restrictions applicable to this TRM include, but are not limited to: (a) exercising either the same degree of care to safeguard the confidentiality of this TRM as you exercise to safeguard the confidentiality of your own most important Confidential Information or a reasonable degree of care, whichever is greater; (b) maintaining agreements with your employees and agents that protect the Confidential Information of third parties such as Oracle Corporation and instructing such employees and agents of these requirements for this TRM; (c) restricting disclosure of this TRM to those of your employees who have a "need to know" consistent with the purposes for which this TRM was disclosed to you; (d) maintaining this TRM at all times on your premises; (e) not removing or destroying any proprietary or confidential legends or markings placed upon this TRM in whatever form, software or printed matter; and (f) not reproducing or transmitting this TRM in any form or by any means, electronic or mechanical, for any purpose, without the express written permission of Oracle Corporation. You should not use this TRM in any form, software or printed matter, to create software that performs the same or similar functions as any Oracle Corporation products.

The information in this TRM is subject to change without notice. If you find any problems in the TRM in any form, software or printed matter, please report them to us in writing. Oracle Corporation does not warrant that this TRM is error-free. This TRM is provided to customer "as-is" with no warranty of any kind. This TRM does not constitute Documentation as that term is defined in Oracle's agreements.

Reverse engineering of the Programs (software and documentation) associated with this TRM are prohibited. The Programs associated with this TRM are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be licensee's responsibility to take all appropriate fail-safe, back-up, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and Oracle disclaims liability for any damages caused by such use of the Programs.

#### Restricted Rights Legend

## BOM\_OPERATION\_SEQUENCES

BOM\_OPERATION\_SEQUENCES stores information about routing operations. You may define multiple operations for a routing. You must specify the department in which every operation will occur.

Oracle Bills of Material stores the STANDARD\_OPERATION\_ID if you use a standard operation to define your operation.

You cannot have overlapping effective dates for the same operation. The Define Routing window will prevent you from doing that. For example, you cannot define operations as follows:

Op Seq	Effective Date	Disable Date
---	-----	-----
10	10-SEP-93	10-DEC-93
10	20-OCT-93	

### Foreign Keys

## FND\_CURRENCIES

FND\_CURRENCIES stores information about currencies. Each row includes the currency code (CURRENCY\_CODE) established by ISO (International Standards Organization) standard, the name of the currency (NAME), a flag to indicate whether the currency is enabled for use at your site (ENABLED\_FLAG), a flag to indicate if this is a currency or a statistical unit (CURRENCY\_FLAG), and the territory code of the issuing country (ISSUING\_TERRITORY\_CODE). Each row also includes the number of digits to the right of the decimal point (PRECISION), the extended precision (EXTENDED\_PRECISION), the symbol denoting the currency, a description of the currency, and descriptive flexfield attribute columns. There is also information on when the currency becomes active and inactive, and the minimum accountable unit for the currency. You need one row for each currency defined with Oracle Application Object Library. Oracle Application Object Library uses this information to display dynamic currency values. You can also use this information to assign a currency to a Set of Books.

## FND\_DUAL

FND\_DUAL stores a dummy constant value. You always need at least one row in this table. Oracle Application Object Library provides this table as a base table for forms that only submit concurrent requests (such as reporting forms) and therefore need to perform a commit cycle without updating an application database table. Such forms generally insert a record into this table (usually the value 1). You should delete rows from this table occasionally, but you should always leave at least one row in this table (for a form that may update a record instead of inserting one).

Column Descriptions

Name	Null?	Type	Description
DUMMY	NULL	NUMBER(2)	Dummy column

## GL\_APPLICATION\_GROUPS

GL\_APPLICATION\_GROUPS replaces FND\_APPLICATION\_GROUPS. It holds rows for individual application product groups. For each application product group listed in this table, Oracle General Ledger's Accounting Calendar form maintains a separate set of accounting period statuses. Thus for each period defined in the Accounting Calendar form, a row is inserted into GL\_PERIOD\_STATUSES for each row in GL\_APPLICATION\_GROUPS.

# GL\_BALANCES

GL\_BALANCES stores actual, budget, and encumbrance balances for detail and summary accounts. This table stores functional currency, foreign currency, and statistical balances for each accounting period that has ever been opened. ACTUAL\_FLAG is either 'A', 'B', or 'E' for actual, budget, or encumbrance balances, respectively. If ACTUAL\_FLAG is 'B', then BUDGET\_VERSION\_ID is required. If ACTUAL\_FLAG is 'E', then ENCUMBRANCE\_TYPE\_ID is required. GL\_BALANCES stores period activity for an account in the PERIOD\_NET\_DR and PERIOD\_NET\_CR columns. The table stores the period beginning balances in BEGIN\_BALANCE\_DR and BEGIN\_BALANCE\_CR. An account's year-to-date balance is calculated as BEGIN\_BALANCE\_DR - BEGIN\_BALANCE\_CR + PERIOD\_NET\_DR - PERIOD\_NET\_CR. Detail and summary foreign currency balances that are the result of posted foreign currency journal entries have TRANSLATED\_FLAG set to 'R', to indicate that the row is a candidate for revaluation.

For foreign currency rows, the begin balance and period net columns contain the foreign currency balance, while the begin balance and period net BEQ columns contain the converted functional currency balance. Detail foreign currency balances that are the result of foreign currency translation have TRANSLATED\_FLAG set to 'Y' or 'N'. 'N' indicates that the translation is out of date (i.e., the account needs to be retranslated). 'Y' indicates that the translation is current. Summary foreign currency balances that are the result of foreign currency translation have TRANSLATED\_FLAG set to NULL. All summary account balances have TEMPLATE\_ID not NULL. The columns that end in ADB are not used. Also, the REVALUATION\_STATUS column is not used.

## GL\_CODE\_COMBINATIONS

GL\_CODE\_COMBINATIONS stores valid account combinations for each Accounting Flexfield structure within your Oracle General Ledger application. Associated with each account are certain codes and flags, including whether the account is enabled, whether detail posting or detail budgeting is allowed, and others.

Segment values are stored in the SEGMENT columns. Note that each Accounting Flexfield structure may use different SEGMENT columns within the table to store the flexfield value combination. Moreover, the SEGMENT columns that are used are not guaranteed to be in any order.

The Oracle Application Object Library table FND\_ID\_FLEX\_SEGMENTS stores information about which column in this table is used for each segment of each Accounting Flexfield structure. Summary accounts have SUMMARY\_FLAG = 'Y' and TEMPLATE\_ID not NULL. Detail accounts have SUMMARY\_FLAG = 'N' and TEMPLATE\_ID NULL.

## GL\_INTERFACE

GL\_INTERFACE is the table you use to import journal entry batches through Journal Import. You insert rows in this table and then use the Import Journals form to create journal batches. You must supply values for all NOT NULL columns. For a complete description of how to load this table, see the Oracle General Ledger User Guide.

## GL\_INTERFACE\_CONTROL

GL\_INTERFACE\_CONTROL is used to control Journal Import execution. Whenever you start Journal Import from the Import Journals form, a row is inserted into this table for each source and group identifier that you specified. When Journal Import completes, it deletes these rows from the table. Processed\_table\_code should be set to 'R' if the table should be dropped after all of the data in it is successfully processed, 'D' if the data should be deleted after it is successfully processed, but the table should be left alone, and 'S' if the data should be left in the interface table even after it is successfully processed. If no value is specified for processed\_table\_code, then a value of 'D' is assumed.

## GL\_JE\_BATCHES

GL\_JE\_BATCHES stores journal entry batches. Each row includes the batch name, description, status, running total debits and credits, and other information. This table corresponds to the Batch window of the Enter Journals form. STATUS is 'U' for unposted, 'P' for posted, 'S' for selected, 'I' for in the process of being posted. Other values of status indicate an error condition. STATUS\_VERIFIED is 'N' when you create or modify an unposted journal entry batch. The posting program changes STATUS\_VERIFIED to 'I' when posting is in process and 'Y' after posting is complete.

## GL\_JE\_CATEGORIES\_TL

GL\_JE\_CATEGORIES\_TL stores journal entry categories. Each row includes the category name and description. Each journal entry in your Oracle General Ledger application is assigned a journal entry category to identify its purpose. This table corresponds to the Journal Categories form. This table has no foreign keys, other than the standard Who columns.

## GL\_JE\_HEADERS

GL\_JE\_HEADERS stores journal entries. There is a one-to-many relationship between journal entry batches and journal entries. Each row in this table includes the associated batch ID, the journal entry name and description, and other information about the journal entry. This table corresponds to the Journals window of the Enter Journals form. STATUS is 'U' for unposted, 'P' for posted. Other statuses indicate that an error condition was found. A complete list is below.

CONVERSION\_FLAG equal to 'N' indicates that you manually changed a converted amount in the Journal Entry Lines zone of a foreign currency journal entry. In this case, the posting program does not reconvert your foreign amounts. This can happen only if your user profile option MULTIPLE\_RATES\_PER\_JE is 'Yes'.  
BALANCING\_SEGMENT\_VALUE is null if there is only one balancing segment value in your journal entry. If there is more than one, BALANCING\_SEGMENT\_VALUE is the greatest balancing segment value in your journal entry.

Following is a list of STATUS codes for this table:

- Bad rounding account
- > Reserved for country – specific functionality
- < Reserved for country – specific functionality
- U Unposted
- P Posted
- 1 Invalid currency code
- 2 Invalid source
- 3 Invalid category
- 4 Invalid Set of Books

## GL\_JE\_LINES

GL\_JE\_LINES stores the journal entry lines that you enter in the Enter Journals form. There is a one-to-many relationship between journal entries and journal entry lines. Each row in this table stores the associated journal entry header ID, the line number, the associated code combination ID, and the debits or credits associated with the journal line. STATUS is 'U' for unposted or 'P' for posted.

## GL\_JE\_SOURCES\_TL

GL\_JE\_SOURCES\_TL stores journal entry source names and descriptions. Each journal entry in your Oracle General Ledger application is assigned a source name to indicate how it was created. This table corresponds to the Journal Sources form. This table has no foreign keys other than the standard Who columns.

## GL\_PERIODS

GL\_PERIODS stores information about the accounting periods you define using the Accounting Calendar form. Each row includes the start date and end date of the period, the period type, the fiscal year, the period number, and other information. There is a one-to-many relationship between a row in the GL\_PERIOD\_SETS table and rows in this table.

## GL\_PERIOD\_STATUSES

GL\_PERIOD\_STATUSES stores the statuses of your accounting periods. Each row includes the accounting period name and status. Other applications maintain their calendars in this table, so each row also includes the relevant application identifier. CLOSING\_STATUS is either 'O' for open, 'F' for future enterable, 'C' for closed, 'P' for permanently closed, or 'N' for never opened. Note that you cannot successfully open a period in your Oracle General Ledger application by changing a period's status to 'O' if it has never been opened before. You must use the Open and Close Periods form to properly open a period.

## Database Triggers

Trigger Name : GL\_MRC\_PERIOD\_STATUSES\_AU  
 Trigger Time : AFTER  
 Trigger Level : STATEMENT  
 Trigger Event : UPDATE

The GL\_MRC\_PERIOD\_STATUSES\_AU trigger maintains the subledger period statuses for reporting sets of books. Whenever a subledger period is opened, closed, or permanently closed for a primary Set of Books, this trigger opens, closes, or permanently closes the corresponding subledger period in the associated reporting sets of books.

Trigger Name : GL\_MRC\_PERIOD\_STATUSES\_BRU  
 Trigger Time : BEFORE  
 Trigger Level : ROW  
 Trigger Event : UPDATE

The GL\_MRC\_PERIOD\_STATUSES\_BRU trigger caches data necessary for the GL\_MRC\_PERIOD\_STATUSES\_AU trigger. It also does some maintenance of period statuses necessary for the Global Accounting Engine.

## GL\_PERIOD\_TYPES

GL\_PERIOD\_TYPES stores the period types you define using the Period Types form. Each row includes the period type name, the number of periods per fiscal year, and other information. YEAR\_TYPE\_IN\_NAME is 'C' for calendar or 'F' for fiscal. This determines the system-assigned name of your accounting period in the Accounting Calendar form.

## GL\_SETS\_OF\_BOOKS

GL\_SETS\_OF\_BOOKS stores information about the sets of books you define in your Oracle General Ledger application. Each row includes the Set of Books name, description, functional currency, and other information. This table corresponds to the Set of Books form.

## GL\_TRANSACTION\_RATE\_EXCEPTIONS

This table is used to implement the Dual Currency feature. It holds rate exceptions for transactions from different source systems. Each record will be expanded into its corresponding journal details by each product's own gather system. The resulting journal details are put in GL\_WEIGHTED\_AVG\_DETAILS table.

## GL\_WEIGHTED\_AVG\_DETAILS

GL\_WEIGHTED\_AVG\_DETAILS table is used to implement the Dual Currency feature. It holds translation rates for journal details from different source systems. The translation rates can be regular exchange rates or rate exceptions users enter manually for specific journal details. The rates entered are used to calculate weighted average translation for each distinct account.

# HR\_ORGANIZATION\_INFORMATION

HR\_ORGANIZATION\_INFORMATION is used to hold two distinct sets of organization information. When ORG\_INFORMATION\_CONTEXT is set to CLASS this table acts as an intersection table between organizations and organization classifications. ORGANIZATION\_ID identifies the organization and ORG\_INFORMATION1 holds the organization classification name. This information is maintained by the organization classifications block of the Organization form. When ORG\_INFORMATION\_CONTEXT is set to an information type held in HR\_ORG\_INFORMATION\_TYPES the ORG\_INFORMATION1-20 columns hold details for the specific information type. This information is maintained by a predefined protected descriptive flexfield. (Org Developer DF.)

This trigger will create a security profile when an organization is defined as a business group. The security profile ID is stored in HR\_ORGANIZATION\_INFORMATION.ORG\_INFORMATION14

Trigger Name : HR\_ORG\_INFO\_ARI  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : INSERT

This trigger inserts Business Group information when an Organization is defined as a business group.

## HZ\_BILLING\_PREFERENCES

The HZ\_BILLING\_PREFERENCES table stores information about the invoice format and media that is requested by a customer account or customer account site. For example, a customer account site may request that although a Latin American subsidiary is based in Florida, United States all invoices should be in Spanish and sent to the subsidiary on a CD-ROM.

The primary key for this table is BILLING\_PREFERENCES\_ID.

## HZ\_CERTIFICATIONS

The HZ\_CERTIFICATIONS table stores information about accreditation that is awarded to a party usually following the evaluation of the party by the awarding organization. For example, the International Organization for Standardization has established standards for quality systems. An ISO9000 certification is awarded after an evaluation of an organization that demonstrates adherence to the standards specified by the ISO.

The primary key for this table is CERTIFICATION\_ID.

PARTY_ID	NOT NULL	NUMBER(15)	Unique identifier for a party. Foreign key to the HZ_PARTIES table.
COUNTRY_CODE	NOT NULL	VARCHAR2(2)	ISO code for the country from which a person claims citizenship. Foreign key to the FND_TERRITORIES table
DATE_DISOWNED	NULL	DATE	Date when an individual renounced citizenship. Usually a self-declared date that might not match a legal effective date.
DATE_RECOGNIZED	NULL	DATE	Date when the country granted citizenship to the individual. For a native-born person, this date is typically the person's date of birth.
DOCUMENT_REFERENCE	NULL	VARCHAR2(60)	A number such as passport number or naturalization reference number associated with DOCUMENT_TYPE.
END_DATE	NULL	DATE	Date that the country recognizes as the end of citizenship.
DOCUMENT_TYPE	NULL	VARCHAR2(30)	The class of document that confirms citizenship. For example, a passport, or naturalization papers.

## HZ\_CLASS\_CATEGORIES

The HZ\_CLASS\_CATEGORIES table stores the information about categories that is used to classify parties and related entities. The possible values for class categories include NAICS, SIC 1987, and Customer Category. You should define a record in the FND\_LOOKUP\_TYPES table before you enter any code in this table. You can define any custom category definition in the FND\_LOOKUP\_TYPES table.

The primary key for this table is CLASS\_CATEGORY.

### QuickCodes Columns

### Column Descriptions

Name	Null?	Type	Description
CLASS_CATEGORY (PK)	NOT NULL	VARCHAR2(30)	The name of the classification category which identifies the category. The name should be a valid lookup type name defined in the FND_LOOKUP_TYPES table.
ALLOW_MULTI_PARENT_FLAG	NOT NULL	VARCHAR2(1)	Indicates if codes under this category can have multiple parent codes. Y for codes that can have multiple parents, N for codes that cannot have multiple parents.
ALLOW_MULTI_ASSIGN_FLAG	NOT NULL	VARCHAR2(1)	Indicates if codes under this category can be assigned to an object more than once. Y for codes that can be assigned multiple times to an object, N for codes that can only be assigned once.
CREATED_BY	NOT NULL	NUMBER(15)	Standard Who column
CREATION_DATE	NOT NULL	DATE	Standard Who column

## HZ\_CLASS\_CATEGORY\_USES

The HZ\_CLASS\_CATEGORY\_USES table stores information about the tables which are going to use a particular class category. For example, the SIC 1987 class category can be used to classify the parties, which have the party type of Organization.

The primary key for this table is OWNER\_TABLE.

### Foreign Keys

## HZ\_CLASS\_CODE\_RELATIONS

The HZ\_CLASS\_CODE\_RELATIONS table stores information about the relationships between parent and child classification codes and the categories in the HZ\_CLASS\_CATEGORIES table. For example, within the North America Industry Classification System (NAICS) Manufacturing category (code 33), the classification code for Radio and Television manufacturers (code 33422) is the child in relation to the classification code for Communications Equipment manufacturers (code 3342).

The primary keys for this table are CLASS\_CATEGORY, CLASS\_CODE, SUB\_CLASS\_CODE, and START\_DATE\_ACTIVE.

## HZ\_CODE\_ASSIGNMENTS

The HZ\_CODE\_ASSIGNMENTS table is an intersection table that links the classification codes in the FND\_LOOKUP\_VALUES table to the names of parties or other entities stored in the table identified in the OWNER\_TABLE\_NAME column. For example, the classification code for databases can be linked to Oracle Corporation.

The primary key for this table is CODE\_ASSIGNMENT\_ID.

## HZ\_CONTACT\_POINTS

The HZ\_CONTACT\_POINTS table stores information about how to communicate to parties or party sites using electronic media or methods such as Electronic Data Interchange (EDI), e-mail, telephone, telex, and the Internet. For example, telephone-related data can include the type of telephone line, a touch tone indicator, a country code, the area code, the telephone number, and an extension number to a specific handset.

NOTE: Each media or method should be stored as a separate record in this table. For example, the attributes of a complete telephone connection should be stored in a record, while EDI information should be stored in a different record.

The primary key for this table is CONTACT\_POINT\_ID.

## HZ\_CREDIT\_USAGES

The HZ\_CREDIT\_USAGES table stores information about an association between a credit limit and a credit usage rule set. This ultimately defines the coverage of any given credit limit. A credit limit's usage may extend to one or more predefined credit usage rule sets (and their member credit usage rules).

The primary key for this table is CREDIT\_USAGE\_ID.

## HZ\_CREDIT\_USAGE\_RULES

The HZ\_CREDIT\_USAGE\_RULES table stores information about how transactions in different currencies are grouped together and in a single currency for the purposes of determining a total credit limit and the current credit exposure for transactions denominated in that group of currencies. These rules are assigned to each credit limit. These rules enable cross-currency credit management.

The primary key for this table is CREDIT\_USAGE\_RULE\_ID.

## HZ\_CUST\_ACCOUNTS

The HZ\_CUST\_ACCOUNTS table stores information about customer relationships established with a party. Since a party can have multiple customer accounts, this table may contain several records for a single party. For example, an individual person may establish a personal account, a family account, and a professional account for a consulting practice. Note that the focus of this table is a business relationship and how transactions are conducted in the relationship.

The primary key for this table is CUST\_ACCOUNT\_ID.

## HZ\_CUST\_PROFILE\_AMTS

The HZ\_CUST\_PROFILE\_AMTS table stores information about the credit limits specified for a customer profile class for a single currency. The credit limits of the profile class can then be assigned to specific customer accounts or customer account sites. Many of the values in this table may be default values, from the HZ\_CUST\_PROF\_CLASS\_AMTS table, which can be modified in this table for a specified customer account or customer account site. For example, while the profile class Large Independent Retail Stores may have an overall credit limit of 250,000 Irish punts, you may limit a new customer in this class to an overall credit limit of 50,000 Irish punts.

The primary key for this table is CUST\_ACCT\_PROFILE\_AMT\_ID.

# HZ\_CUST\_PROFILE\_CLASSES

The HZ\_CUST\_PROFILE\_CLASSES table stores information about the credit characteristics that are common across a group of customer accounts. The characteristics specified in this table can be used as default characteristics for similar customer accounts. For example, you can create a profile class called Large Independent Retail Stores and can specify several attributes that describe this class of customer. In the future, you can assign new customers to this class so that the new customer inherits the characteristics of the class.

The primary key for this table is PROFILE\_CLASS\_ID.

## HZ\_CUST\_SITE\_USES\_ALL

The HZ\_CUST\_SITE\_USES\_ALL table stores information about the business purposes assigned to a customer account site. A customer account site can have multiple purposes; however, each record in this table only specifies one purpose for a customer account site. For example, a customer account site may be assigned as a Ship-To site in one record and as a Bill-To site in another record. Note that address information about sites is stored in the HZ\_LOCATIONS table.

The primary key for this table is SITE\_USE\_ID.

## HZ\_DNB\_REQUEST\_LOG

The HZ\_DNB\_REQUEST\_LOG table tracks requests for information from Dun & Bradstreet either in the form of Global Data Products or a Business Information Report. The log identifies the PARTY\_ID that information was requested for, the Dun & Bradstreet product purchased, and the identity of the person who made the request.

The primary key for this table is REQUEST\_ID.

## HZ\_EDUCATION

The HZ\_EDUCATION table stores general information about the educational history of a party of the PERSON type. For example, a person may have attended the University of California from 1995 to 1999 and received an undergraduate degree in Computer Science with a GPA of 4.0. This table stores the information about the university, the period when the person attended, and the course that the student majored in. This table will not store detailed information about the coursework completed or performance in those courses.

The primary key for this table is EDUCATION\_ID.

# HZ\_FINANCIAL\_REPORTS

The HZ\_FINANCIAL\_REPORTS table stores information about the reports on the financial status of a party. This table does not contain numerical financial data. Detailed numerical data is available in the HZ\_FINANCIAL\_NUMBERS table. For example, the records in this table can indicate whether the numerical data in the HZ\_FINANCIAL\_NUMBERS table are actual, estimated, consolidated, and so on.

The primary key for this table is FINANCIAL\_REPORT\_ID.

DOCUMENT_REFERENCE	NULL	VARCHAR2(150)	Any specific reference name or number. For example, a library identifier or publisher's identifier (ISBN) that uniquely identifies the document or publication.
ISSUED_PERIOD	NULL	VARCHAR2(60)	The period covered by the financial report. For example, fiscal year 1999, 1Q98, and so on.
REQUIRING_AUTHORITY	NULL	VARCHAR2(60)	Name of the primary organization that requires this financial report. For example, auditors, the Federal Trade Commission, and the Internal Revenue Service.
TYPE_OF_FINANCIAL_REPORT	NULL	VARCHAR2(60)	A name for the financial report. For example, 10K report, Annual Report, Shareholder's Special Report.
REPORT_START_DATE	NULL	DATE	May use report start and end dates instead of ISSUED_PERIOD.
REPORT_END_DATE	NULL	DATE	May use report start and end dates instead of ISSUED_PERIOD.
AUDIT_IND	NULL	VARCHAR2(30)	Indicates if the financial reports are audited. Y for audited, N for unaudited.
CONSOLIDATED_IND	NULL	VARCHAR2(30)	Indicates if the financial reports are consolidated. C for consolidated, N for unconsolidated.
ESTIMATED_IND	NULL	VARCHAR2(30)	Indicates if the financial reports provide estimated data. Y for estimated, N for actual or measured data.

Column Descriptions (Continued)

Name	Null?	Type	Description
FISCAL_IND	NULL	VARCHAR2(30)	Indicates if the financial reports cover a fiscal twelve-month accounting period. Y for a twelve-month fiscal period, N for anything other than a twelve-month fiscal period.
FINAL_IND	NULL	VARCHAR2(30)	Indicates if the financial reports are the final closing statements for a business that has ceased operations. Y for final closing statements, N for normal operations.
FORECAST_IND	NULL	VARCHAR2(30)	Indicates if the financial reports display forecasts or future projections. Y for forecast data, N for historical data.
OPENING_IND	NULL	VARCHAR2(30)	Indicates if the financial reports are the opening statements for a business. Y for opening statements, N for normal operations.
PROFORMA_IND	NULL	VARCHAR2(30)	Indicates if the financial reports are pro forma numbers. Y for pro forma numbers, N for normal numbers.
QUALIFIED_IND	NULL	VARCHAR2(30)	Indicates if the financial reports include qualifying remarks from auditors about the fairness and accuracy of the numbers. Y for reports qualified by auditors, N for reports that were not qualified.
RESTATED_IND	NULL	VARCHAR2(30)	Indicates if the financial reports include data that was corrected after the original financial reports. Y for restated, N for the original numbers.
SIGNED_BY_PRINCIPALS_IND	NULL	VARCHAR2(30)	Indicates if the financial reports were signed by the principals of the organization. Y for signed reports, N for unsigned reports.
TRIAL_BALANCE_IND	NULL	VARCHAR2(30)	Indicates if the financial reports include trial balance numbers. Y for trial balance numbers, N for normal numbers.
UNBALANCED_IND	NULL	VARCHAR2(30)	Indicates if the financial reports include balance sheet accounts that do not balance. Y for reports that include unbalanced balance sheet accounts. N for reports that only include balanced accounts.
CONTENT_SOURCE_TYPE	NOT NULL	VARCHAR2(30)	Source of data content
CREATED_BY	NOT NULL	NUMBER(15)	Standard Who column
CREATION_DATE	NOT NULL	DATE	Standard Who column

## HZ\_LOCATIONS

The HZ\_LOCATIONS table stores information about a delivery or postal address such as building number, street address, postal code, and directions to a location. This table provides physical location information about parties (organizations and people) and customer accounts. For example, you can store information such as Building 300, 500 Oracle Parkway, 94065, and "Take the Ralston Avenue exit from Highway 101, go east on Twin Dolphin Drive, turn left on Oracle Parkway, watch for the Building 300 sign on your right."

Records in the HZ\_LOCATIONS table can store delivery and postal information about a location through columns such as the LOCATION\_DIRECTIONS, POST\_OFFICE, and TIME\_ZONE columns. You can also use the HZ\_LOCATIONS table to store latitude and longitude information. Data in the HZ\_LOCATIONS table is also used to determine the appropriate tax authority and tax rates for sales tax and VAT calculations.

The primary key for this table is LOCATION\_ID.

## HZ\_LOC\_ASSIGNMENTS

The HZ\_LOC\_ASSIGNMENTS table stores information about the relationship between a location defined in the HZ\_LOCATIONS table and a tax authority defined in the AR\_LOCATION\_COMBINATIONS table. The appropriate sales tax can be calculated when you assign a location to a tax authority. In a multi-org environment, a record is created for each organization at the location.

## HZ\_MERGE\_BATCH

The HZ\_MERGE\_BATCH table stores header information about a party merge batch. The records in this table are created in the Merge Parties form.

### Column Descriptions

Name	Null?	Type	Description
BATCH_ID	NOT NULL	NUMBER(15)	Sequence generated identifier to uniquely identify a batch
RULE_SET_NAME	NOT NULL	VARCHAR2(30)	Rule Set that will be used to merge the batch. The value will default to the pre-seeded value
BATCH_NAME	NOT NULL	VARCHAR2(30)	User entered name of the batch
REQUEST_ID	NULL	NUMBER(15)	Request identifier of the last concurrent program to update this record
BATCH_STATUS	NOT NULL	VARCHAR2(30)	Status of the batch. This column is updated by the concurrent program.
BATCH_COMMIT	NOT NULL	VARCHAR2(1)	Y indicates commit performed after merging all parties in the batch. N indicates commit performed after each party in the batch is merged.
BATCH_DELETE	NOT NULL	VARCHAR2(1)	Y indicates merged records are to be deleted after merge. N indicates merged records are not deleted.
MERGE_REASON_CODE	NULL	VARCHAR2(30)	Reason for Batch Creation. Based on Lookup type MERGE_REASON in AR_LOOKUPS
CREATED_BY	NOT NULL	NUMBER(15)	Standard Who column
CREATION_DATE	NOT NULL	DATE	Standard Who column

## HZ\_MERGE\_PARTY\_DETAILS

The HZ\_MERGE\_PARTY\_DETAILS table stores information about records in the sub-entities of the HZ\_PARTIES table where you want to control operations that are performed on the records by creating rows in this table to override the default operation to be performed.

For example, to specify that a Party site record in the from\_party is to be merged with another in the to\_party, a record is created in this table, with ENTITY\_NAME=HZ\_PARTY\_SITES, MERGE\_FROM\_ENTITY\_ID=<The ID of the party site to be merged> and MERGE\_TO\_ENTITY\_ID=< The ID of the party site with which to merge>. The entries in this table are created in the Merge Parties form.

## HZ\_MERGE\_PARTY\_HISTORY

The HZ\_MERGE\_PARTY\_HISTORY table stores information about the operations performed and the records affected by a party merge operation. Operations that could have been performed as a result of a merge could either be Merge or Transfer. For example, if a Party Site were transferred to the Merge-to Party, a record is created in this table.

## HZ\_MERGE\_PARTY\_LOG

The HZ\_MERGE\_PARTY\_LOG table stores information about the operations performed as a result of a party merge. The structure of this table is the same as the HZ\_MERGE\_PARTY\_HISTORY table. The rows in this table are generated even if the merge is not completed or fails. If the Party Merge Concurrent program runs in the "Preview" Mode, rows are also created. If an error was encountered when merging one of the records, the error message is recorded in the ERROR\_MESSAGES column for that merge. The entries in this table are created by the party merge concurrent program.

## HZ\_ORGANIZATION\_PROFILES

The HZ\_ORGANIZATION\_PROFILES table stores a variety of information about a party. This table gets populated when a party of the Organization type is created. This table also contains data retrieved from Dun & Bradstreet using either the Dun & Bradstreet online or batch download methods. Historical data for the organization can also be stored in this table. Each time organization information is changed, the effective end date column for the original record is updated and a new record that contains the updated information is created.

The primary key for this table is ORGANIZATION\_PROFILE\_ID.

## HZ\_ORG\_CONTACTS

The HZ\_ORG\_CONTACTS table stores information about the position of the contact for a party or party site. The records in this table provide information about a contact position such as JOB\_TITLE, RANK, and general contact information. This table is not used to store information about a specific person or organization, such as name and identification codes. That information is stored in the HZ\_PARTIES table. For example, this table may include a record for the position of vice president of manufacturing that indicates that the contact is a senior executive, but it would not include the name of the person in that position.

The primary key for this table is ORG\_CONTACT\_ID.

## HZ\_ORG\_CONTACT\_ROLES

The HZ\_ORG\_CONTACT\_ROLES table stores information about the role of the contact position that is specified in the HZ\_ORG\_CONTACTS table. Contacts may have multiple roles. For example, a vice president of manufacturing may have a custom-defined role as a member of a capital expenditures review board.

The primary key for this table is ORG\_CONTACT\_ROLE\_ID.

## HZ\_PARTIES

The HZ\_PARTIES table stores basic information about parties that can be shared with any relationship that the party might establish with another party. Although a record in the HZ\_PARTIES table represents a unique party, multiple parties can have the same name. The parties can be one of four types:

- Organization—for example, Oracle Corporation
- Person—for example, Jane Doe
- Group—for example, World Wide Web Consortium
- Relationship—for example, Jane Doe at Oracle Corporation.

Party records can be created and updated using third party data sources such as Dun & Bradstreet's Global Data Products. The HZ\_PARTIES table contains denormalized information from the HZ\_LOCATIONS, HZ\_PERSON\_PROFILES, HZ\_CONTACT\_POINTS, HZ\_ORGANIZATION\_PROFILES, and HZ\_PERSON\_LANGUAGE tables. The identifying address contained in the HZ\_PARTIES table is denormalized from the HZ\_LOCATIONS table.

The primary key for this table is PARTY\_ID.

## HZ\_PARTY\_INTERFACE

The HZ\_PARTY\_INTERFACE table stores information about a party that was retrieved from an external source. Currently this data can be retrieved from Dun & Bradstreet using either the Dun & Bradstreet online or batch download methods. The columns in this table include all the Dun & Bradstreet data elements that are available in the Dun & Bradstreet Global Data Products. The column names are from our data model, but the column definitions currently are based on the data dictionary provided by Dun & Bradstreet.

The primary key for this table is PARTY\_INTERFACE\_ID.

## HZ\_PARTY\_SITES

The HZ\_PARTY\_SITES table links a party (see HZ\_PARTIES) and a location (see HZ\_LOCATIONS) and stores location-specific party information such as MAILSTOP and ADDRESSEE. One party can optionally have one or more party sites. One location can optionally be used by one or more parties. For example, 500 Oracle Parkway can be specified as a party site for Oracle Corporation. This party site can then be used for multiple customer accounts within the same party.

The primary key for this table is PARTY\_SITE\_ID.

## HZ\_PERSON\_INTEREST

The HZ\_PERSON\_INTEREST table stores information about the sports, hobbies, and personal interests of a party of the Person type. This information could be helpful in developing a more personalized relationship with a business contact. For example, a customer may indicate that he has an interest in driving in sports car races for the past seven years or attending baseball games.

The primary key for this table is PERSON\_INTEREST\_ID.

## HZ\_RELATIONSHIPS

The HZ\_RELATIONSHIPS table stores information about relationships between one party and another party. The SUBJECT\_ID and OBJECT\_ID columns specify the relationship that exists between two parties. For example, if the party relationship is of the Parent Of type, a holding company could be the SUBJECT\_ID in the relationship while one of its subsidiaries could be the OBJECT\_ID. Creating a party contact causes a party relationship to be created. A party can have different relationships with one or more other parties. A party relationship can be specified with specific start and end dates so that the subject or object of a relationship can change over time.

The primary key for this table is RELATIONSHIP\_ID.

## HZ\_RELATIONSHIP\_TYPES

The HZ\_RELATIONSHIP\_TYPES table defines the business rules that are associated with a relationship type. A non-directional relationship type consists of a single record with the same forward (FORWARD\_REL\_CODE) and backward (BACKWARD\_REL\_CODE) relationship codes. A directional relationship type consists of two records: one for the parent (DIRECTION\_CODE is P) and the other for a child (DIRECTION\_CODE is C) of that parent. Forward and backward relationship codes are validated against the PARTY\_RELATIONS\_TYPE lookup type.

The primary key for this table is RELATIONSHIP\_TYPE\_ID.

## HZ\_ROLE\_RESPONSIBILITY

The HZ\_ROLE\_RESPONSIBILITY table stores information about the required or expected activities of a party based on the party's role or function in relation to an account. Note that the role referred to in this table may not be the same as the role of a contact in an organization (see the HZ\_ORG\_CONTACT\_ROLES table). For example, in this table you may store "Accepts quality of received materials" as a responsibility of the Incoming Material Quality Control role specified in the HZ\_CUST\_ACCOUNT\_ROLES table. The party with the role responsibility may not be an individual person.

The primary key for this table is RESPONSIBILITY\_ID.

## HZ\_SUSPENSION\_ACTIVITY

The HZ\_SUSPENSION\_ACTIVITY table stores information about discontinuing sales or service to a customer. For example, this table could be used to store the information that on February 8, 2001, a letter was sent via registered US mail to a customer account site that stated that service to that site would be discontinued on April 1, 2001 due to delayed payments.

The primary key for this table is SUSPENSION\_ACTIVITY\_ID.

## HZ\_WORD\_REPLACEMENTS

The HZ\_WORD\_REPLACEMENTS table stores pairs of words so that a user-entered original word (which can be a word, word fragment, abbreviation, and so on that is bracketed by white space) can return the same search results as a replacement word in this table during a fuzzy search. For example, if a user entered "Ave", an address that includes "Avenue" is included in the results.

TYPE can have one of five values:

- KEY MODIFIER
- ORGANIZATION
- ADDRESS
- FIRST-NAME
- LAST-NAME

The TYPE value indicates the algorithm to which the rule applies. Rule of type KEY MODIFIER apply to the other four types.

The primary keys for this table are ORIGINAL\_WORD and TYPE.

## HZ\_WORK\_CLASS

The HZ\_WORK\_CLASS table stores custom-defined classification information about a person's job title and work experience. For example, one system may use classifications such as "Electrician" and "Master" while another may use job codes and seniority indicators such as "EM3" and "over 20" to indicate a class 3 Master Electrician with over 20 years of experience. Note that there may be multiple records in the HZ\_WORK\_CLASS table for each record in the HZ\_EMPLOYMENT\_HISTORY table.

The primary key for this table is WORK\_CLASS\_ID.

## MTL\_CATEGORIES\_B

MTL\_CATEGORIES\_B is the code combinations table for item categories. Items are grouped into categories within the context of a category set to provide flexible grouping schemes.

The item category is a key flexfield with a flex code of MCAT. The flexfield structure identifier is also stored in this table to support the ability to define more than one flexfield structure (multi-flex).

Item categories now support multilingual category description. MLS is implemented with a pair of tables: MTL\_CATEGORIES\_B and MTL\_CATEGORIES\_TL. MTL\_CATEGORIES\_TL table holds translated Description for Categories.

## MTL\_ITEM\_CATEGORIES

MTL\_ITEM\_CATEGORIES stores inventory item assignments to categories within a category set. For each category assignment, this table stores the item, the category set, and the category. Items always may be assigned to multiple category sets. However, depending on the Multiple Assignments Allowed attribute value in a given category set definition, an item can be assigned to either many or only one category in that category set.

This table may be populated through the Master Items and Organization Items windows. It can also be populated by performing item assignments when a category set is defined. It is also populated when an item is transferred from engineering to manufacturing. The table may also be populated through the Item Category Open Interface.

## Database Triggers

Trigger Name : AX\_MTL\_ITEM\_CATEGORIES\_AR11  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : INSERT

This trigger captures information needed to create subledger accounting events when Oracle Inventory and the Set of Books used is defined as a subledger in the Global Accounting Engine application. This trigger maintains data in AX\_CATEGORY\_ACCOUNTS table. It ensures that no transactions are created without a subinventory. The trigger fires right after an item is assigned to a category.

Trigger Name : AX\_MTL\_ITEM\_CATEGORIES\_ARU1  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : UPDATE

This trigger captures information needed to create subledger accounting events when Oracle Inventory and the Set of Books used is defined as a subledger in the Global Accounting Engine application. This trigger maintains data in AX\_CATEGORY\_ACCOUNTS table. It ensures that no transactions are created without a subinventory. The trigger fires right after an item category assignment is changed.

## MTL\_SYSTEM\_ITEMS\_B

MTL\_SYSTEM\_ITEMS\_B is the definition table for items. This table holds the definitions for inventory items, engineering items, and purchasing items. You can specify item-related information in fields such as: Bill of Material, Costing, Purchasing, Receiving, Inventory, Physical attributes, General Planning, MPS/MRP Planning, Lead times, Work in Process, Order Management, and Invoicing.

You can set up the item with multiple segments, since it is implemented as a flexfield. Use the standard 'System Items' flexfield that is shipped with the product to configure your item flexfield. The flexfield code is MSTK.

The primary key for an item is the INVENTORY\_ITEM\_ID and ORGANIZATION\_ID. Therefore, the same item can be defined in more than one organization.

Each item is initially defined in an item master organization. The user then assigns the item to other organizations that need to recognize this item. A row is inserted for each new organization the item is assigned to. Many columns such as MTL\_TRANSACTIONS\_ENABLED\_FLAG and BOM\_ENABLED\_FLAG correspond to item attributes defined in the MTL\_ITEM\_ATTRIBUTES table. The attributes that are available to the user depend on which Oracle applications are installed. The table MTL\_ATTR\_APPL\_DEPENDENCIES maintains the relationships between item attributes and Oracle applications.

Two unit of measure columns are stored in MTL\_SYSTEM\_ITEMS table. PRIMARY\_UOM\_CODE is the 3-character unit that is used throughout Oracle Manufacturing. PRIMARY\_UNIT\_OF\_MEASURE is the 25-character unit that is used throughout Oracle Purchasing.

Items now support multilingual description. MLS is implemented with a pair of tables: MTL\_SYSTEM\_ITEMS\_B and MTL\_SYSTEM\_ITEMS\_TL. Translations table (MTL\_SYSTEM\_ITEMS\_TL) holds item descriptions in multiple languages. DESCRIPTION column in the base table (MTL\_SYSTEM\_ITEMS\_B) is for backward compatibility and is maintained in the installation base language only.

## Database Triggers

Oracle Proprietary, Confidential Information--Use Restricted by Contract

Trigger Name : MTL\_SYSTEM\_ITEMS\_T6\_BOM  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : INSERT

This trigger creates categories corresponding to product family items being created. It also assigns product family items to their corresponding categories. The trigger uses data that has been stored in the BOM\_PFI\_PVT package PL/SQL tables by the row level trigger.

Trigger Name : MTL\_SYSTEM\_ITEMS\_T1\_BOM  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT

This trigger stores product family item identifier used later by the statement level trigger for creation of the corresponding category when a new product family item is defined. It makes calls to the BOM\_PFI\_PVT package procedures.

Trigger Name : MTL\_SYSTEM\_ITEMS\_B\_T2\_BOM  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : DELETE

This trigger stores corresponding category identifier that is used later by the statement level trigger for deletion of the category when the product family item is deleted. It makes calls to BOM\_PFI\_PVT package procedures.

Trigger Name : MTL\_SYSTEM\_ITEMS\_T3\_BOM  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : UPDATE

This trigger performs the following functions depending on conditions: 1. Creates product family category when item attribute BOM\_ITEM\_TYPE is updated to 5. 2. When the item attribute BOM\_ITEM\_TYPE is changed from 5 to any other value, the trigger stores corresponding category identifier for later deletion of the category by the statement level trigger. 3. Removes an item assignment to the corresponding product family category when the PRODUCT\_FAMILY\_ITEM\_ID column of that item is changed. 4. When the PRODUCT\_FAMILY\_ITEM\_ID column is changed to non-null, stores category ID in the BOM\_PFI\_PVT package PL/SQL table for an item assignment to that category later by the statement-level trigger.

Trigger Name : MTL\_SYSTEM\_ITEMS\_T4\_BOM  
Trigger Time : AFTER  
Trigger Level : STATEMENT  
Trigger Event : UPDATE

This trigger performs the following functions depending on updates of the BOM\_ITEM\_TYPE and PRODUCT\_FAMILY\_ITEM\_ID columns: 1. Creates categories corresponding to product family items. 2. Assigns new product family items to their corresponding categories. 3. Deletes product family categories. The trigger uses data that has been stored in the BOM\_PFI\_PVT package PL/SQL tables by the row level trigger.

Trigger Name : MTL\_SYSTEM\_ITEMS\_T5\_BOM  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : DELETE

This trigger deletes categories corresponding to product family items being deleted. The trigger uses data that has been stored in the BOM\_PFI\_PVT package PL/SQL tables by the row level trigger.

Trigger Name : MTL\_SYSTEM\_ITEMS\_T1  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : UPDATE

The trigger is executed when the COSTING\_ENABLED\_FLAG field in the MTL\_SYSTEM\_ITEMS table is modified from Yes to No or vice versa. Before updating COSTING\_ENABLED\_FLAG field, the trigger performs the following tasks for each record that is modified:

- Insert a record into CST\_ITEM\_COSTS table if  
COSTING\_ENABLED\_FLAG field is changed from No to Yes.
- Delete a record from CST\_ITEM\_COSTS table if  
COSTING\_ENABLED\_FLAG field is changed from Yes to No.

Trigger Name : MTL\_SYSTEM\_ITEMS\_B\_T2\_IBE  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : DELETE

This trigger calls iStore procedures to update relationships, section-items and search tables that depend on MTL\_SYSTEM\_ITEMS\_B table.

Trigger Name : MTL\_SYSTEM\_ITEMS\_B\_T3\_IBE  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : UPDATE

This trigger calls iStore procedures to update relationships and section-items tables that depend on MTL\_SYSTEM\_ITEMS\_B table.

## MTL\_UNITS\_OF\_MEASURE\_TL

MTL\_UNITS\_OF\_MEASURE\_TL is the definition table for both the 25-character and the 3-character units of measure. The base\_uom\_flag indicates if the unit of measure is the primary unit of measure for the uom\_class. Oracle Inventory uses this table to keep track of the units of measure used to transact an item. This table is also used by Oracle Purchasing, Oracle Order Management and Oracle Shipping Execution.

## ORG\_FREIGHT\_TL

ORG\_FREIGHT is the definition table for freight carriers. It also holds the distribution account information.

The freight carrier (FREIGHT\_CODE) and freight charge distribution account (DISTRIBUTION\_ACCOUNT) are used in inter-organization transfers.

Freight carriers are defined in the Freight Carriers window in Oracle Inventory.

## RA\_BATCHES\_ALL

The RA\_BATCHES\_ALL table stores information about each invoice or bills receivable batch that you enter in Oracle Receivables. Each row in this table includes information about each batch that belongs to a batch source. The TYPE column contains the INV value for all records. The STATUS and BATCH\_SOURCE\_ID columns are required even though they are null allowed.

The primary key for this table is BATCH\_ID.

### *Database Triggers*

Trigger Name : RA\_MRC\_BATCHES\_BIUD  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT, UPDATE, DELETE

The RA\_MRC\_BATCHES\_BIUD trigger is an MRC trigger that exists only when you install the Multiple Reporting Currencies feature. This trigger is executed when you perform an insert, update, or delete statement on the RA\_BATCHES\_ALL table. For each record that is inserted, updated, or deleted in the RA\_BATCHES\_ALL table, this trigger inserts, updates, or deletes the corresponding reporting currency records in the RA\_MC\_BATCHES MRC subtable.

## RA\_BATCH\_SOURCES\_ALL

The RA\_BATCH\_SOURCES\_ALL table stores information about the sources of your invoices, credit memos, and commitments. Each row includes information about invoice, batch, and credit memo numbering. Oracle Receivables creates one row for each batch source that you define. Receivables uses batch sources to default a transaction type during invoice entry and to determine invoice, batch, and credit memo numbering.

The BATCH\_SOURCE\_TYPE column stores INV for manual batches or FOREIGN for imported batches. The STATUS, CREDIT\_MEMO\_BATCH\_SOURCE\_ID, AUTO\_BATCH\_NUMBERING, and AUTO\_TRX\_NUMBERING columns are required even though they are null allowed.

The primary key for this table is BATCH\_SOURCE\_ID.

## RA\_CM\_REQUESTS\_ALL

The RA\_CM\_REQUESTS\_ALL table stores information about credit memo requests that a customer made with the Dispute A Bill feature of iReceivables, known as AR Online in Release 11. Receivables creates one row in this table for each request that a customer makes using the Dispute A Bill feature. This table contains all parameters that are required to initiate the Credit Memo Request Workflow.

Each row in this table includes general information about the request such as amount, reason, comments, and if the request concerns specific invoice lines or just a credit to the total line, tax, or freight on the transaction. A value of Y in the LINES\_CREDITS\_FLAG column indicates that the customer made the credit request for specific lines.

The CUSTOMER\_TRX\_ID column is the transaction identifier and the CM\_CUSTOMER\_TRX\_ID column is the credit memo identifier, once Receivables approves and creates the credit memo.

The primary keys for this table are REQUEST\_ID and CUSTOMER\_TRX\_ID.

## RA\_CM\_REQUEST\_LINES\_ALL

The RA\_CM\_REQUEST\_LINES\_ALL table stores information about specific lines that a customer selected for a credit memo request with the Dispute A Bill feature of iReceivables, known as AR Online in Release 11.

Each row in this table includes general information about the selected credit request lines, such as the transaction line identifier and the extended amount of the transaction line. This table contains as many rows as the number of specific line credit requests that were made for a particular credit memo request.

The primary keys for this table are REQUEST\_ID and CUSTOMER\_TRX\_LINE\_ID.

## RA\_CONTACT\_PHONES\_INT\_ALL

The RA\_CONTACT\_PHONES\_INT\_ALL table is one of the Customer Interface tables that Oracle Receivables uses to import contact and telephone information for your customers' addresses and business purposes. Receivables uses this customer information to create records in the RA\_CONTACTS and RA\_PHONES tables.

Enter one row for each contact or telephone number. Receivables deletes all information from this table after your data conversion is successfully complete. For more information about customer conversion, see the Oracle Receivables User Guide. The INSERT\_UPDATE\_FLAG column stores the these values:

- I – To insert a new record
- U – To update an existing record

The VALIDATED\_FLAG column stores Y or N to indicate if this record has been validated.

### Column Descriptions

Name	Null?	Type	Description
ORIG_SYSTEM_CONTACT_REF	NULL	VARCHAR2(240)	Unique contact identifier from foreign system

# RA\_CUSTOMERS\_INTERFACE\_ALL

The RA\_CUSTOMERS\_INTERFACE\_ALL table is one of the Customer Interface tables that Oracle Receivables uses to import customer, address, customer profiles, and site use information. Receivables uses this customer information to create records in the RA\_CUSTOMERS, RA\_ADDRESSES\_ALL, RA\_CUSTOMER\_RELATIONSHIPS\_ALL, and RA\_SITE\_USES\_ALL tables. Receivables deletes all information from this table after your customer data is successfully imported. For more information about customer conversion, see the Oracle Receivables User Guide.

Customer Interface uses INTERFACE\_STATUS column is used by Customer Interface to store any error messages that apply to the interface record. Please refer to the Oracle Applications Messages Manual for a list of Customer Interface error messages.

The REQUEST\_ID column stores the request ID of the last concurrent request that you submitted to run customer interface.

The INSERT\_UPDATE\_FLAG column stores I if you are inserting a new row or U if you are updating an existing record.

The VALIDATED\_FLAG column stores Y or N to indicate if this record was validated.

The primary keys for this table are ORIG\_SYSTEM\_CUSTOMER\_REF, ORIG\_SYSTEM\_ADDRESS\_REF, and SITE\_USE\_CODE.

 Trigger Event : DELETE

The JL\_BR\_AR\_BEF\_DEL\_CUST\_INT trigger populates the GLOBAL\_ATTRIBUTE2 through the GLOBAL\_ATTRIBUTE8 columns in the RA\_ADDRESSES\_ALL table with information from the RA\_CUSTOMERS\_INTERFACE\_ALL table. This trigger also validates the values of these global attributes and populates invalid customer record information in the JL\_BR\_AR\_CUST\_INT\_ERR temporary table. This trigger is active only if Oracle Financials for the Americas is used.

## RA\_CUSTOMER\_BANKS\_INT\_ALL

The RA\_CUSTOMER\_BANKS\_INT\_ALL table is used by the Customer Interface program to store customer bank account information. For example, Oracle Receivables might use this table to store information about a Bank of America branch, located in Sunnyvale, California, that is used by a customer to pay invoices.

## RA\_CUSTOMER\_MERGES

The RA\_CUSTOMER\_MERGES table stores customer, address, and site use information that you are merging using the Customer Merge program. Each row in this table includes the names and IDs of the customers, addresses, or site uses that are merged. Oracle Receivables uses this information to display in the Merge Customers window all customers, addresses, and site uses that were merged.

The primary key for this table is CUSTOMER\_MERGE\_ID.

## RA\_CUSTOMER\_MERGE\_HEADERS

The RA\_CUSTOMER\_MERGE\_HEADERS table contains a row for each customer that is merged by the Customer Merge program. If slightly different entries for the same company exist, this table holds the header-level information for both companies, while the Customer Merge program merges the duplicate entries.

For example, if you merge the customer record for Gen. Technologies with the customer record for General Technologies, this table would hold header-level information about the two company records.

The primary key for this table is CUSTOMER\_MERGE\_HEADER\_ID.

## RA\_CUSTOMER\_PROFILES\_INT\_ALL

The RA\_CUSTOMER\_PROFILES\_INT\_ALL table is used by the Customer Interface program to store customer profile information. If you enter a new customer, you must either pass a customer profile class that already exists in Oracle Receivables, or pass customer profile values. Values in this table are not required if you are not entering a new customer or assigning customer profile information to customer addresses.

# RA\_CUSTOMER\_TRX\_ALL

The RA\_CUSTOMER\_TRX\_ALL table stores invoice, debit memo, commitment, bills receivable, and credit memo header information. Each row in this table includes general invoice information such as customer, transaction type, and printing instructions. One row exists for each invoice, debit memo, commitment, bill receivable, and credit memo that you create in Oracle Receivables. Invoices, debit memos, credit memos, bills receivable, and commitments are distinguished by their associated transaction types, which are stored in the RA\_CUST\_TRX\_TYPES\_ALL table.

If you entered a credit memo, the PREVIOUS\_CUSTOMER\_TRX\_ID column stores the customer transaction ID of the invoice that you credited. In the case of on-account credits, which are not related to any invoice when the credits are created, the PREVIOUS\_CUSTOMER\_TRX\_ID column is null. If you create an invoice against a commitment, Receivables stores the customer transaction ID of the commitment in the INITIAL\_CUSTOMER\_TRX\_ID column. Otherwise, the INITIAL\_CUSTOMER\_TRX\_ID column is null.

The COMPLETE\_FLAG column stores Y or N to indicate if the invoice is complete. When you complete an invoice, Receivables creates your payment schedules and updates any commitments against this invoice. Before an invoice can be completed, the invoice must have at least one invoice line, revenue records must exist for each line and add up to the line amount, and a sales tax record must exist for each line.

The SOLD\_TO\_CUSTOMER\_ID, SOLD\_TO\_SITE\_USE\_ID, BILL\_TO\_CUSTOMER\_ID, BILL\_TO\_SITE\_USE\_ID, SHIP\_TO\_SITE\_USE\_ID, PRINTING\_OPTION, PRINTING\_PENDING, TERM\_ID, REMIT\_TO\_ADDRESS\_ID, PRIMARY\_SALES\_REP\_ID, and INVOICE\_CURRENCY\_CODE columns are required even though they are null allowed.

The primary key for this table is CUSTOMER\_TRX\_ID.

The AX\_RA\_CUSTOMER\_TRX\_ARD1 trigger captures information that is needed to create subledger accounting events when the Set of Books is defined as a Global Accounting Engine Set of Books for Oracle Receivables. This trigger captures accounting events that are related to Receivables transactions and executes after a transaction is deleted. This trigger may insert, update, or delete rows in the AX\_DOCUMENT\_STATUSES and AX\_EVENTS tables.

Trigger Level : ROW  
Trigger Event : INSERT

The JL\_BR\_AR\_AUTO\_INT\_PARAM trigger defaults interest parameters into the global attributes of the RA\_CUSTOMER\_TRX\_ALL table when AutoInvoice creates a transaction. This trigger is active only if Oracle Financials for the Americas is used.

Trigger Name : RA\_MRC\_CUSTOMER\_TRX\_BIUD  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT, UPDATE, DELETE

The RA\_MRC\_CUSTOMER\_TRX\_BIUD trigger is an MRC trigger that exists only when you install the Multiple Reporting Currencies feature and executes when you perform an insert, update, or delete statement on the RA\_CUSTOMER\_TRX\_ALL table. For each record that is inserted, updated, or deleted in the RA\_CUSTOMER\_TRX\_ALL table, this trigger inserts, updates, or deletes corresponding reporting currency records in the RA\_MC\_CUSTOMER\_TRX MRC subtable. This trigger also populates the MRC VARCHAR2 columns in the RA\_CUSTOMER\_TRX\_ALL table.

Trigger Name : JL\_BR\_AR\_OCC\_DOCS\_DIS\_N\_OTHER  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : UPDATE

The JL\_BR\_AR\_OCC\_DOCS\_DIS\_N\_OTHER trigger inserts a new record in the JL\_BR\_AR\_OCCURRENCE\_DOCS\_ALL table after the interest parameters are updated for an invoice that is with a collection bank. This trigger executes after the GLOBAL\_ATTRIBUTE1, GLOBAL\_ATTRIBUTE2, GLOBAL\_ATTRIBUTE3, and GLOBAL\_ATTRIBUTE5 columns of the RA\_CUSTOMER\_TRX\_ALL table are updated and is active only if Oracle Financials for the Americas is used.

Trigger Name : JG\_ZZ\_AR\_AUTO\_TRX\_NUM\_UPD  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : UPDATE

The JG\_ZZ\_AR\_AUTO\_TRX\_NUM\_UPD trigger updates transaction number with a country-specific number when transaction is completed.

Trigger Name : GMF\_AR\_CUST\_TRX\_AIUR\_TG  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : INSERT, UPDATE

The GMF\_AR\_CUST\_TRX\_AIUR\_TG trigger will update the status of the OPM sales order lines to INVOICED and update the OPM sales order to either PARTIALLY INVOICED, or INVOICED after AutoInvoicing inserts a row in the RA\_CUSTOMER\_TRX\_ALL table. 22 for Partially Invoiced, 23 for Invoiced.

## RA\_CUSTOMER\_TRX\_LINES\_ALL

The RA\_CUSTOMER\_TRX\_LINES\_ALL table stores information about invoice, debit memo, credit memo, bills receivable, and commitment lines. For example, an invoice can have one line for Product A and another line for Product B. Each line requires one row in this table.

Invoice, debit memo, credit memo, bills receivable, and commitment lines are distinguished by the transaction type of the corresponding row in the RA\_CUSTOMER\_TRX\_ALL table. Credit memos must also have a value in the PREVIOUS\_CUSTOMER\_TRX\_LINE\_ID column. On-account credits, which are not related to specific invoices or invoice lines when they are created, will not have values in this column.

The QUANTITY\_ORDERED column stores the amount of product that was ordered. The QUANTITY\_INVOICED column stores the amount of product that was invoiced. For manually entered invoices, the QUANTITY\_ORDERED and QUANTITY\_INVOICED columns must be the same. For invoices that were imported through AutoInvoice, the QUANTITY\_ORDERED and QUANTITY\_INVOICED columns can be different. If you enter a credit memo, the QUANTITY\_CREDITED column stores the amount of product that was credited.

The UOM\_CODE column stores the unit of measure code as defined in the MTL\_UNITS\_OF\_MEASURE table. The UNIT\_STANDARD\_PRICE column stores the list price per unit for this transaction line. The UNIT\_SELLING\_PRICE column stores the selling price per unit for this transaction line. For transactions that were imported through AutoInvoice, the UNIT\_STANDARD\_PRICE and UNIT\_SELLING\_PRICE columns can be different. The DESCRIPTION, TAXING\_RULE, QUANTITY\_ORDERED, UNIT\_STANDARD\_PRICE, UOM\_CODE, and UNIT\_SELLING\_PRICE columns are required even though they are null allowed.

Receivables uses the LINE\_TYPE column to distinguish between the different types of lines that are stored in this table. LINE represents regular invoice lines that normally refer to an item. TAX represents a tax line. The LINK\_TO\_CUST\_TRX\_LINE\_ID column references the invoice line that is associated with the row that holds the TAX line type. FREIGHT is similar to TAX, but you can have at most one freight line per invoice line. You can also have one freight line that has a null LINK\_TO\_CUST\_TRX\_LINE\_ID column. An invoice that has one freight line with a null LINK\_TO\_CUST\_TRX\_LINE\_ID column has header-level freight.

CB represents a chargeback line. For every row in this table that belongs to a completed postable or nonpostable transaction, where the RA\_CUSTOMER\_TRX.COMPLETE\_FLAG is Y, there must be at least one row in the RA\_CUST\_TRX\_LINE\_GL\_DIST table that stores accounting information. There must be at least one row in this table even for nonpostable transactions.

The primary key for this table is CUSTOMER\_TRX\_LINE\_ID.

# RA\_CUST\_TRX\_LINE\_GL\_DIST\_ALL

The RA\_CUST\_TRX\_LINE\_GL\_DIST\_ALL table stores the accounting records for revenue, unearned revenue, and unbilled receivables for each invoice or credit memo line. Oracle Receivables creates one row for each accounting distribution, and at least one accounting distribution must exist for each invoice or credit memo line. Each row in this table includes the General Ledger account and the amount of the accounting entry. The AMOUNT column is required even though this column is null allowed. Receivables uses this information to post the proper amounts to General Ledger.

If your invoice or credit memo has a transaction type where Post to GL is set to No, Receivables assigns Null to the GL\_DATE column. If AutoAccounting is unable to complete your General Ledger default accounts using the AutoAccounting rules that you defined, incomplete General Ledger accounts are stored in the CONCATENATED\_SEGMENTS column. If you are importing a transaction through AutoInvoice and the General Ledger date of your transaction is in a closed accounting period, AutoInvoice uses the General Ledger date of the first open accounting period and stores the original General Ledger date in the ORIGINAL\_GL\_DATE column.

The ACCOUNT\_CLASS column defines this distribution row type. A REC value in the ACCOUNT\_CLASS column represents the receivable account and contains the total invoice amount. At most, two REC rows may exist: one row with the ACCOUNT\_SET\_FLAG column set to Y, and one row with the ACCOUNT\_SET\_FLAG column set to N. The LATEST\_REC\_FLAG column joins the row that is set to N.

The ACCOUNT\_SET\_FLAG column is Y if this row is part of an account set. An account set, which is a set of rows that represents a model distribution, is used for invoices with rules. The rows in an account set indicate how Receivables should create the actual distribution rows and what percentage of the actual distribution Receivables should allocate to each account. For invoices with rules, Receivables does not create the distributions when the invoice is initially created. Instead, Receivables creates the invoices when the Revenue Recognition program is run.

The primary key for this table is CUST\_TRX\_LINE\_GL\_DIST\_ID.

## Database Triggers

Trigger Name : AX\_CUST\_TRX\_LINE\_GL\_ARDI1  
 Trigger Time : AFTER  
 Trigger Level : ROW  
 Trigger Event : INSERT, DELETE

The AX\_CUST\_TRX\_LINE\_GL\_ARDI1 trigger captures information that is needed to create subledger accounting events when the Set of Books is defined as a Global Accounting Engine Set of Books for Oracle Receivables. This trigger captures accounting events that are related to accounting distribution lines for Receivables invoices or credit memos and executes when an accounting distribution line is created or deleted. This trigger may insert, update, or delete rows in the AX\_DOCUMENT\_STATUSES and AX\_EVENTS tables.

Trigger Name : AX\_CUST\_TRX\_LINE\_GL\_ARU1  
 Trigger Time : AFTER  
 Trigger Level : ROW  
 Trigger Event : UPDATE

**Oracle Proprietary, Confidential Information--Use Restricted by Contract**

The AX\_CUST\_TRX\_LINE\_GL\_ARU1 trigger captures information that is needed to create subledger accounting events when the Set of Books is defined as a Global Accounting Engine Set of Books for Oracle Receivables. This trigger captures accounting events that are related to Receivables transaction distribution lines and executes when an accounting distribution line's posting control identifier is changed. This trigger updates the unposted line count in the AX\_DOCUMENT\_STATUSES table.

Trigger Name : RA\_CUST\_TRX\_LINE\_GL\_DIST\_BRI  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT

The RA\_CUST\_TRX\_LINE\_GL\_DIST\_BRI trigger updates the LATEST\_REC\_FLAG column to Y after a record is inserted into the RA\_CUST\_TRX\_LINE\_GL\_DIST\_ALL table, if the value of the ACCOUNT\_CLASS column is REC.

Trigger Name : RA\_MRC\_TRX\_LINE\_GL\_DIST\_BIUD  
Trigger Time : BEFORE  
Trigger Level : ROW  
Trigger Event : INSERT, UPDATE, DELETE

The RA\_MRC\_TRX\_LINE\_GL\_DIST\_BIUD trigger is an MRC trigger that only exists when you install the Multiple Reporting Currencies feature. This trigger is executed when you perform an insert, update, or delete statement on the RA\_CUST\_TRX\_LINE\_GL\_DIST\_ALL table. For each record that is inserted, updated, or deleted in the RA\_CUST\_TRX\_LINE\_GL\_DIST\_ALL table, this trigger inserts, updates, or deletes corresponding reporting currency records in the RA\_MC\_TRX\_LINE\_GL\_DIST MRC subtable. This trigger also populates the MRC VARCHAR2 columns in the RA\_CUST\_TRX\_LINE\_GL\_DIST\_ALL table.

Trigger Name : AX\_CUST\_TRX\_LINE\_GL\_ARU2  
Trigger Time : AFTER  
Trigger Level : ROW  
Trigger Event : UPDATE

The AX\_CUST\_TRX\_LINE\_GL\_ARU2 trigger captures information that is needed to create subledger accounting events when the Set of Books is defined as a Global Accounting Engine Set of Books for Oracle Receivables. This trigger captures accounting events that are related to Receivables transactions and executes when the GL\_DATE column of an accounting distribution line is changed. This trigger creates events in the AX\_EVENTS table.

## RA\_CUST\_TRX\_LINE\_SALESREPS\_ALL

The RA\_CUST\_TRX\_LINE\_SALESREPS\_ALL table stores sales credit assignments for invoice lines. If Receivables bases your invoice distributions on sales credits, a mapping exists between the sales credit assignments in this table with the RA\_CUST\_TRX\_LINE\_GL\_DIST\_ALL table.

The primary key for this table is CUST\_TRX\_LINE\_SALESREP\_ID.

# RA\_CUST\_TRX\_TYPES\_ALL

The RA\_CUST\_TRX\_TYPES\_ALL table stores information about each transaction type that is used for invoices, commitments, bills receivable, and credit memos. Each row includes AutoAccounting information as well as standard defaults for the invoices that result.

The POST\_TO\_GL column stores Y or N to indicate if this transaction can post to your General Ledger.

The ACCOUNTING\_AFFECT\_FLAG column stores Y or N to indicate if this transaction can update your open receivables balances. If the ACCOUNTING\_AFFECT\_FLAG column is Y, you can see this transaction in your agings.

The TYPE column contains:

- INV – Invoice
- CM – Credit Memo
- DM – Debit Memo
- DEP – Deposit
- GUAR – Guarantee

If AutoAccounting is based on transaction type, the GL\_ID\_REV, GL\_ID\_FREIGHT, and GL\_ID\_REC columns store the default revenue, freight, and receivables accounts. The STATUS and CREDIT\_MEMO\_TYPE\_ID columns are required even though they are null allowed.

The primary key for this table is CUST\_TRX\_TYPE\_ID.

## RA\_GROUPING\_RULES

The RA\_GROUPING\_RULES table stores grouping rules used by AutoInvoice. Grouping rules determine how different invoice lines from the RA\_INTERFACE\_LINES\_ALL AutoInvoice table are grouped together to create an invoice.

Grouping rules contain various transaction attributes that must be identical for the same transaction. For example, if transaction number is part of your grouping rule and you have two records in the interface tables with different transaction numbers, AutoInvoice will create two transactions.

The primary key for this table is GROUPING\_RULE\_ID.

## RA\_GROUPING\_TRX\_TYPES

The RA\_GROUPING\_TRX\_TYPES table is an intersection of grouping rules, as defined in the RA\_GROUPING\_RULES table, and transaction classes. Depending on the transaction class, each grouping rule can use different methods to group together invoice lines to create an invoice.

The primary keys for this table are GROUPING\_RULE\_ID and CLASS.

## RA\_GROUP\_BY

The RA\_GROUP\_BY table holds a row for every column that each grouping rule uses to group invoice lines. For example, if you define a grouping rule that groups invoice lines by purchase order number and shipping date, two rows will exist in this table for each combination of transaction class, as defined in the RA\_GROUPING\_TRX\_TYPES table, and grouping rule.

The primary keys for this table are GROUPING\_TRX\_TYPE\_ID and COLUMN\_ID.

## RA\_GROUP\_BY\_COLUMNS

The RA\_GROUP\_BY\_COLUMNS table stores the list of columns that AutoInvoice can use to group interface lines into invoices. For example, this table might hold the AGREEMENT\_ID, PURCHASE\_ORDER, TAX\_CODE, and TERRITORY\_ID columns as possible attributes for grouping.

The primary key for this table is COLUMN\_ID.

## RA\_INTERFACE\_DISTRIBUTIONS\_ALL

The RA\_INTERFACE\_DISTRIBUTIONS\_ALL table stores information about the accounting distributions for transactions that were imported using AutoInvoice. If you do not use AutoAccounting, you must enter accounting distributions for your transactions.

If your accounting distributions are for transactions that use accounting rules, you must enter the percentages instead of the amounts, for your distribution lines. If you enter the amounts, AutoInvoice ignores those values.

If your accounting distributions are for transactions that do not use accounting rules, you can enter either the percentages or amounts, depending on the value that you entered for your batch source. If you enter an amount, AutoInvoice requires that the sum of the distribution amounts equals the total amount of the transaction. If you enter a percent, AutoInvoice requires that the sum of the distribution percentages equals 100 for each account class that you pass.

The primary key for this table is INTERFACE\_DISTRIBUTION\_ID.

# RA\_INTERFACE\_ERRORS\_ALL

The RA\_INTERFACE\_ERRORS\_ALL table stores information about interface data that failed the AutoInvoice validation step. Oracle Receivables uses the information in this table to generate the AutoInvoice Validation report. AutoInvoice identifies all errors for each transaction line, thus reducing multiple validation and correction cycles.

The primary keys for this table are INTERFACE\_LINE\_ID, INTERFACE\_SALESCREDIT\_ID, and INTERFACE\_DISTRIBUTION\_ID.

Column Descriptions

## RA\_INTERFACE\_LINES\_ALL

The RA\_INTERFACE\_LINES\_ALL table stores interface information for each invoice line that AutoInvoice imports into Oracle Receivables. For detailed information about this table, including detailed column descriptions, refer to "Importing Invoice Information into Oracle Receivables Using AutoInvoice" in the Oracle Receivables User Guide.

The primary key for this table is INTERFACE\_LINE\_ID.

# RA\_INTERFACE\_SALESCREDITS\_ALL

The RA\_INTERFACE\_SALESCREDITS\_ALL table is used by AutoInvoice to import sales credit information for your transactions. The values that you enter for the Require Salesrep parameter in the System Options window and the Allow Sales Credit parameter in the Transaction Sources window determine if you must enter sales credit information.

If you are importing invoices, debit memos, and on-account credits, and the Require Salesrep system option requires a salesperson, you must provide sales credit information, regardless of the Allow Sales Credit parameter’s value for this transaction batch source.

If you are importing credit memos and the Require Salesrep system option requires a salesperson, you can provide sales credit information. If you do not provide sales credit information, AutoInvoice uses sales credit information from the invoice that you are crediting. If the invoice that you are crediting does not have sales credit information, AutoInvoice creates a 100% No Sales Credit line for this invoice and uses this sales credit line to determine the sales credit amount for the credit memo.

Regardless of the transaction type that you are importing, if the Require Salesrep system option does not require a salesperson, but your transaction batch source allows sales credits, you can provide sales credit information. AutoInvoice validates the sales credit information and passes this information with your transaction.

If the Require Salesrep system option does not require a salesperson and your transaction batch source does not allow sales credits, do not provide sales credit information. AutoInvoice ignores any values that you pass.

The primary key for this table is INTERFACE\_SALESCREDIT\_ID.

## RA\_ITEM\_EXCEPTION\_RATES

The RA\_ITEM\_EXCEPTION\_RATES table stores the tax rate that Oracle Receivables uses to calculate tax for specific items that are shipped to a specific location. The tax rate stored here normally overrides the location-based tax that is defined during tax setup.

The primary key for this table is ITEM\_EXCEPTION\_RATE\_ID.

## RA\_LINE\_ORDERING\_RULES

The RA\_LINE\_ORDERING\_RULES table represents a line ordering rule in each row. A line ordering rule is a collection of columns that AutoInvoice uses to sort transaction lines when grouping transactions into invoices, debit memos, and credit memos. Each line ordering rule is assigned to one or more grouping rules.

The primary key for this table is ORDERING\_RULE\_ID.

## RA\_LINE\_ORDER\_BYS

The RA\_LINE\_ORDER\_BYS table contains a row for each column that you define to be part of an AutoInvoice line ordering rule.

The primary keys for this table are ORDERING\_RULE\_ID and ORDER\_BY\_SEQUENCE.

## RA\_LINE\_ORDER\_BY\_COLUMNS

The RA\_LINE\_ORDER\_BY\_COLUMNS table stores the columns that can be used to define AutoInvoice line ordering rules. AutoInvoice uses line ordering rules to order transaction lines when grouping transactions into invoices, debit memos, and credit memos.

The primary key for this table is COLUMN\_ID.

# RA\_MC\_BATCHES

The RA\_MC\_BATCHES table is a Multiple Reporting Currencies (MRC) subtable of the RA\_BATCHES\_ALL table. This table stores currency-related information about each invoice batch for each reporting Set of Books that is associated with the parent record in the RA\_BATCHES\_ALL table.

Column Descriptions

Name	Null?	Type	Description
BATCH_ID	NOT NULL	NUMBER(15)	Batch identifier
SET_OF_BOOKS_ID	NOT NULL	NUMBER(15)	Set of Books identifier

## RA\_MC\_CUSTOMER\_TRX

The RA\_MC\_CUSTOMER\_TRX table is a Multiple Reporting Currencies (MRC) subtable of the RA\_CUSTOMER\_TRX\_ALL table. This table stores currency-related information about invoice, debit memo, commitment, and credit memo header information for each reporting Set of Books that is associated with the parent record in the RA\_CUSTOMER\_TRX\_ALL table.

The primary keys for this table are CUSTOMER\_TRX\_ID and SET\_OF\_BOOKS\_ID.

## RA\_MC\_TRX\_LINE\_GL\_DIST

The RA\_MC\_TRX\_LINE\_GL\_DIST table is a Multiple Reporting Currencies (MRC) subtable of the RA\_CUST\_TRX\_LINE\_GL\_DIST\_ALL table. This table stores currency and accounting records for revenue, unearned revenue, and unbilled receivables for each reporting Set of Books that is associated with the parent record in the RA\_CUST\_TRX\_LINE\_GL\_DIST\_ALL table. Oracle Receivables uses information in this table to post the proper amounts to General Ledger.

The primary keys for this table are CUST\_TRX\_LINE\_GL\_DIST\_ID and SET\_OF\_BOOKS\_ID.

### Column Descriptions

Name	Null?	Type	Description
CUST_TRX_LINE_GL_DIST_ID (PK)	NOT NULL	NUMBER(15)	Revenue distribution identifier

## RA\_RECUR\_INTERIM

The RA\_RECUR\_INTERIM table temporarily holds invoices that Oracle Receivables will copy in the future. Receivables deletes these records after the records are successfully loaded into permanent Receivables invoice tables. For example, if you create a recurring invoice for \$1200 over 12 months, Receivables temporarily holds the invoice that you created for January in this table until the identical invoices are generated.

The primary keys for this table are CUSTOMER\_TRX\_ID and TRX\_NUMBER.

### Column Descriptions

DOC_SEQUENCE_VALUE	NULL	NUMBER(15)	The value of the document sequence
NEW_CUSTOMER_TRX_ID	NULL	NUMBER(15)	Unique identifier of the new recurred invoice

## RA\_REMIT\_TOS\_ALL

The RA\_REMIT\_TOS\_ALL table stores information to link a remit-to address with a state and country. Oracle Receivables creates one row for each country and state combination that you want to associate with a remit-to address. Receivables uses this information to default your remit-to address during invoice and commitment entry. The COUNTRY column is required even though it is null allowed.

The primary keys for this table are COUNTRY, STATE, POSTAL\_CODE\_HIGH, and POSTAL\_CODE\_LOW.

## RA\_RULES

The RA\_RULES table stores invoicing and accounting rules. Receivables creates one row in this table for each invoicing and accounting rule that you define.

Receivables uses invoicing rules to determine when to recognize a receivable for invoices that span more than one accounting period. Assign invoicing rules to invoices that are manually entered or imported into Receivables through AutoInvoice. Receivables provides two invoicing rules: the Bill in Advance rule tells Receivables to recognize your receivable immediately, while the Bill in Arrears rule tells Receivables to recognize the receivable at the end of the revenue recognition schedule.

Receivables uses accounting rules to determine revenue recognition schedules for invoice lines. Receivables stores revenue recognition schedules in the RA\_RULE\_SCHEDULES table. Use accounting rules to specify the number of periods and the percentage of the total revenue to recognize in each period.

The primary key for this table is RULE\_ID.

## RA\_RULE\_SCHEDULES

The RA\_RULE\_SCHEDULES table stores revenue recognition schedules for invoices with accounting rules. Accounting rules determine the number of periods and percentage of total revenue to record in each accounting period. For example, this table stores ARREARS INVOICE or ADVANCED INVOICE.

The primary keys for this table are RULE\_ID and RULE\_DATE.

## RA\_TERMS\_B

The RA\_TERMS\_B table stores standard payment term information. Oracle Receivables creates one row for each payment term that you define. Receivables uses this information to calculate when a payment is due and any discounts that are given for early payment. Receivables stores payment schedules in the AR\_PAYMENT\_SCHEDULES\_ALL table.

The primary key for this table is TERM\_ID.

### Column Descriptions

## RA\_TERMS\_LINES

The RA\_TERMS\_LINES table stores detailed line information for each payment term that you define in the RA\_TERMS\_B table. Oracle Receivables creates one row for each payment term line. Split payment terms have more than one row in this table for a given record in the RA\_TERMS\_B table. Receivables uses this information to calculate when a payment is due.

Receivables stores discount information in the RA\_TERMS\_LINES\_DISCOUNTS table.

The primary keys for this table are TERM\_ID and SEQUENCE\_NUM.

## RA\_TERMS\_TL

The RA\_TERMS\_TL table provides multilingual support (MLS) for each payment term that you define in Oracle Receivables. MLS lets you store and print data that you define in multiple languages.

The primary keys for this table are TERM\_ID and LANGUAGE.

## RA\_TERRITORIES

The RA\_TERRITORIES table stores territory information that is assigned to salespersons in the RA\_SALESREP\_TERRITORIES table.

For example, this table might record information about the Northern California territory, which is assigned to Jane Smith in the RA\_SALESREP\_TERRITORIES table.

The primary key for this table is TERRITORY\_ID.

## Oracle Receivables Applications Technical Reference Manual, Volume 2 A89885-01

Oracle Corporation welcomes your comments and suggestions on the quality and usefulness of this publication. Your input is an important part of the information we use for revision.

- Did you find any errors?
- Is the information clearly presented?
- Do you need more information? If so, where?
- Are the examples correct? Do you need more examples?
- What features did you like most about this manual? What did you like least about it?

If you find any errors or have any other suggestions for improvement, please indicate the topic, chapter, and page number below:
